

Update Robogen Version

STEP 1 – Prerequisite (Not needed for the computers in CM 1103)

We assume that the previous version of Robogen is operational in your computer.

STEP 2 - Remove the old releases and download the latest release:

```
cd ~/Robogen

# Remove old versions of Robogen
rm Robogen-*

# Download new Version 2.3.1 - Beta
wget https://github.com/lis-epfl/robogen-app/releases/download/2.3.1/Robogen-2.3.1-x86_64.AppImage

# Provide access Permissions
chmod +x Robogen-2.3.1-x86_64.AppImage

# Execute
./Robogen-2.3.1-x86_64.AppImage
```

Wait till both the simulator and evolver turns active.

NOTE: This release intends to prevent only future mismatch in Standard Deviation. However, for any of the past evolutions, with very high standard deviations, open the evolution.json file of the corresponding evolution in a text editor. Then identify and replace the high standard deviation value by replacing the calculated standard deviation of the generation.
