Research Question

Whiteboard notes (left):

- fonction continue
- intervalles d'application
- dérivées
- intervalles de positivité/négativité
- "table" récapitulative
- check tableau d'application
- vérification intervalles
- dérivées "partielles" dérivées
- des dérivées "partielles"
- dérivées
- à tester
- à tester
- à tester

Chap. 3) points d'intégration - formules de Gauss

- Soit une fonction de poids $J(x) = \sum_{j=1}^n w_j g_j(x)$ avec $\int_a^b g_j(x) dx$
- $w_j = \int_a^b g_j(x) dx$ $j=1, \dots, n$
- $n=2$ $\int_a^b g(x) dx \approx \sum_{j=1}^2 w_j g(x_j)$
- Existe-t-il un choix judicieux de x_1, x_2 ?
- $n=2$ $x_1 = \frac{a+b}{2}$ $x_2 = \frac{a+b}{2}$ $w_1 = w_2 = 1$ $J(x) = g(x) \ln(g(x))$ $\int_a^b g(x) dx \approx \sum_{j=1}^2 w_j g(x_j) \ln(g(x_j))$ (n=2)

Is it more effective to watch MOOCs individually or in teams ?

Independent
Variable

Solo / Team

Dependent
Variable

Test Score

Depending Variables

Test Score : *retention, understanding, application, extrapolation*
(taxonomy)

(PostTest Score – PreTest Score)= Learning Gain

Differential effects

(DelayedPostTest Score – PostTest Score)= Retention

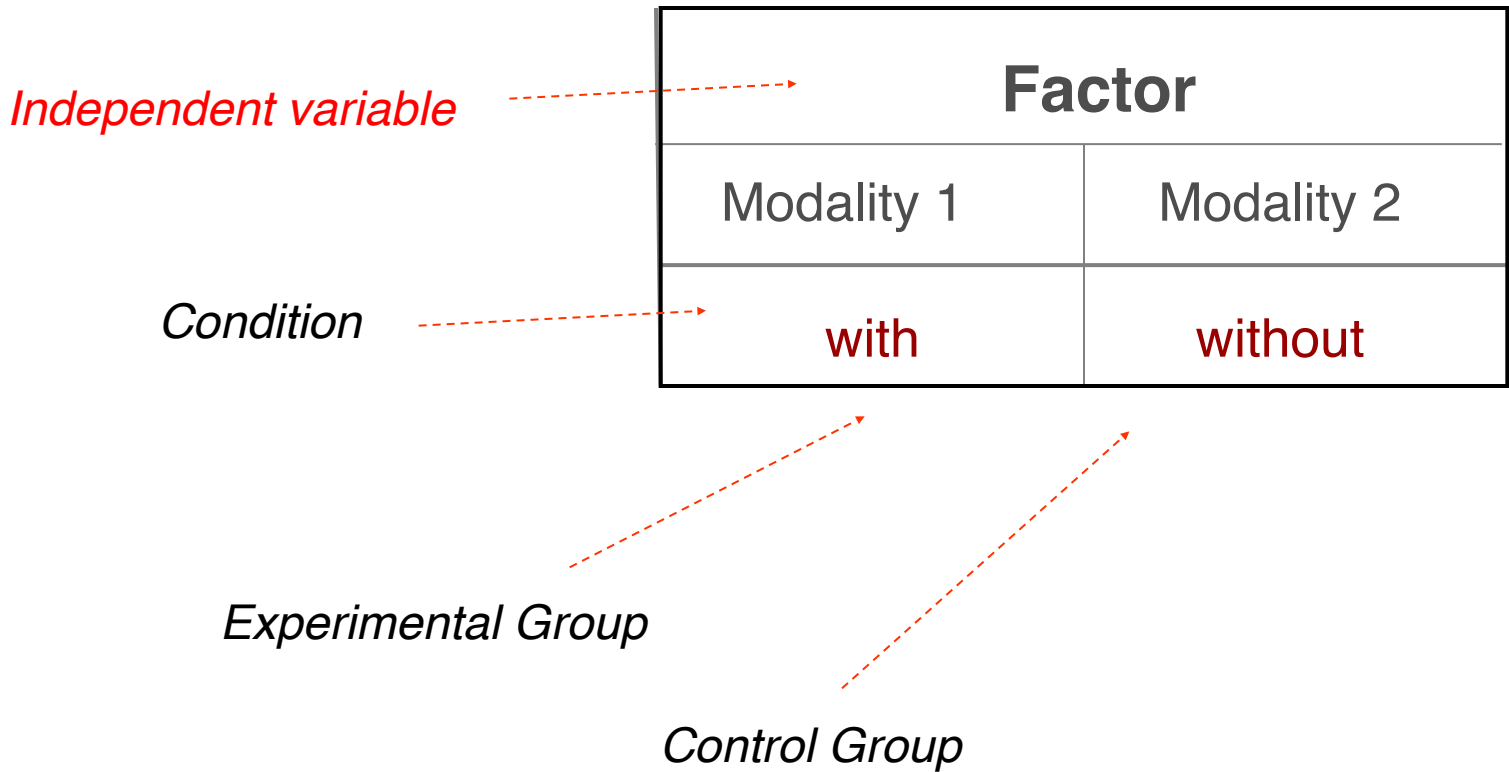

(PostTest Score – PreTest Score)-/100 – PreTest Score)= RelativeLearning Gain

Floor or Ceiling effects

Transfer Score

Job ?, Salary, Happiness,...

Experimental Plan: Between Subjects, 1 dimension

Research Question

Is it more effective to watch MOOCs individually or in small teams ?

Research Sub Questions

It depends on the size of the group

It depends on the school culture

It depends on difficulty of the video

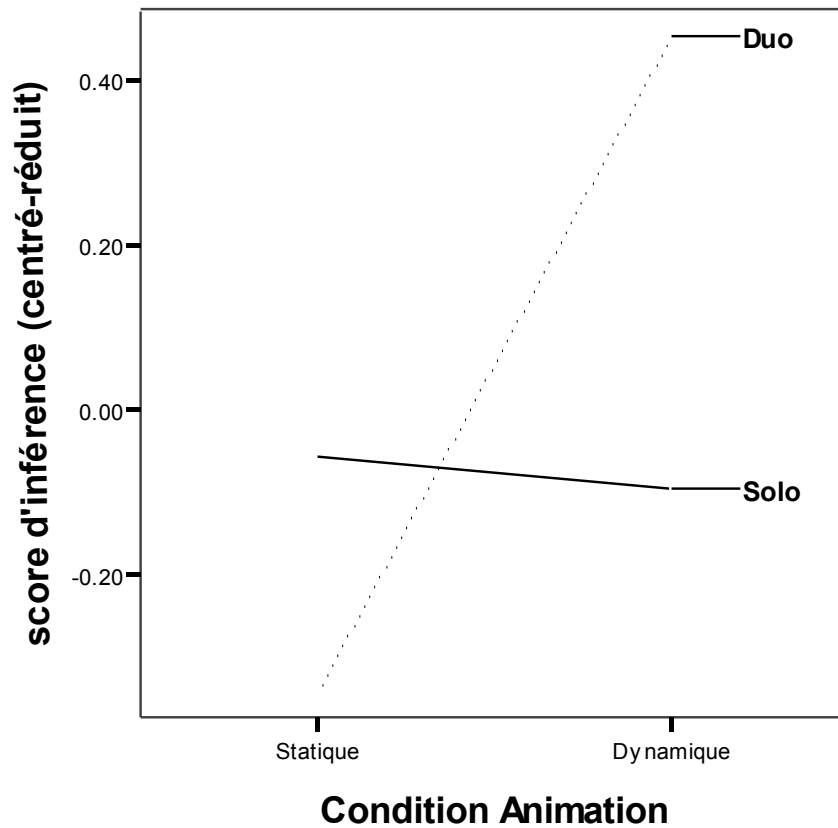

It depends how well the group members know each other

It depends ...

Experimental Plan: Between Subjects, 2 dimensions

		Factor 1	
		Modality 1.1	Modality 1.2
Factor 2	Modality 2.1	Group A	Group E
	Modality 2.2	Group B	Group D
	Modality 2.3	Group C	Group F

Interaction des variables animation et collaboration sur l'inférence

Interaction Effects

The effect of one independent variable on the dependent variable depends upon the other independent variable

Interaction Effect ?

Experiment Biases

Were the groups really equivalent at the beginning ?

- same age (in average) → Questionnaire
- same gender ratio → Questionnaire
- same socio-cultural level → Questionnaire
- same school level → Recruitment
- same background knowledge → Pre-test
- same level for mutual knowledge (friends?) → Recruitment
- same level of intelligence → Pre-test
- same spatial reasoning → Pre-test

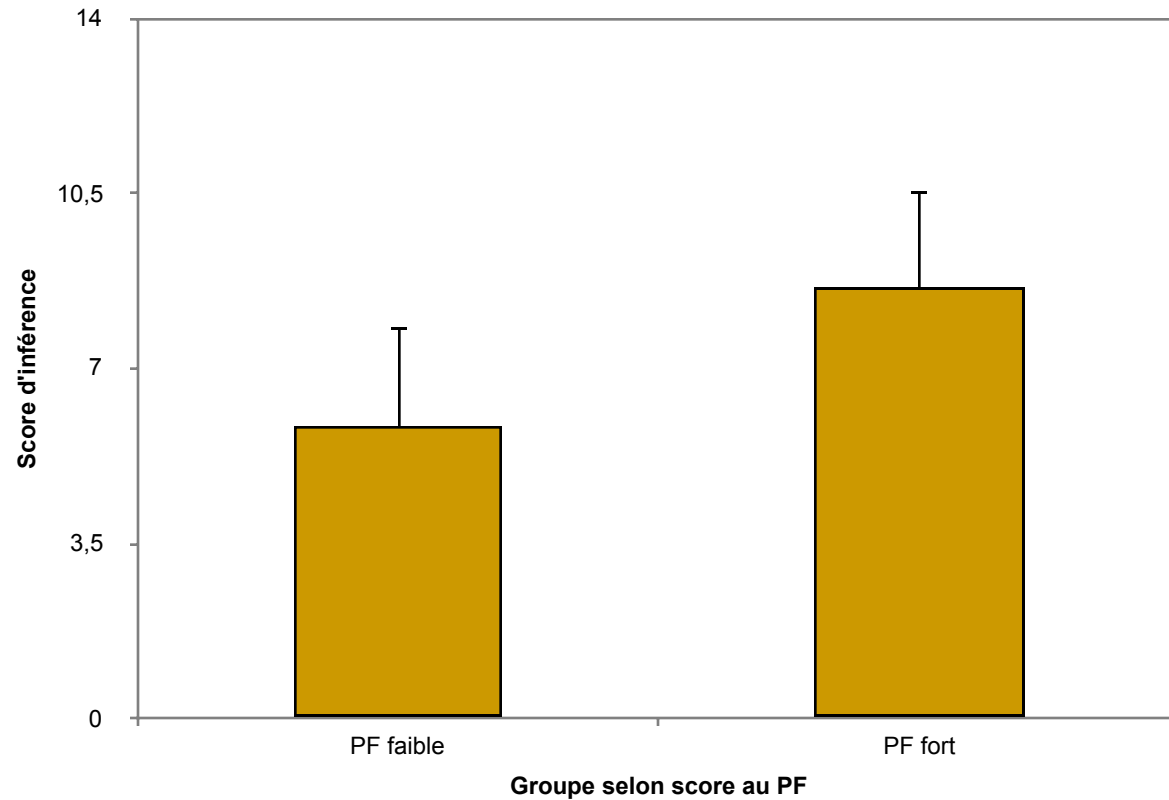

Paper Folding Test

The two figures on the left represent a square piece of paper being folded. In the second figure a small circle shows where a hole has been punched through all of the thicknesses of paper. Choose the drawing on the right that shows where the holes are after the paper has been unfolded.

[Eliot and Smith \(1983\)](#)

Moyennes d'inférence selon les capacités de rotation mentale

Were the groups really equivalent at the beginning ?

SOLUTIONS

(1) Control before forming groups

→ When assigning subjects to conditions

distribute Equally among conditions: **controlled variables**

(2) Control after the experiment

→ Verify that the groups do not differ significantly: **randomized variables**

→ If the groups differ significantly, use **covariate analysis**

(3) Use "repeated measures" also called "within subjects"

The same subjects pass in both conditions

Experimental Plan: **Within** Subjects, 1 dimension

Subjects 1, 3, 5

Subjects 2, 4, 6

Factor	
Modality 1	Modality 2
First	Second
Second	First

COUNTER-BALANCING
(avoiding the order effect)

Pro: fewer subjects, samples are equivalent

Cons: complex order effects

Research Sub Questions

Is it more effective to learn MOOCs
individually or in small teams ?

2. Why are they better ?

3. Why are they better ?

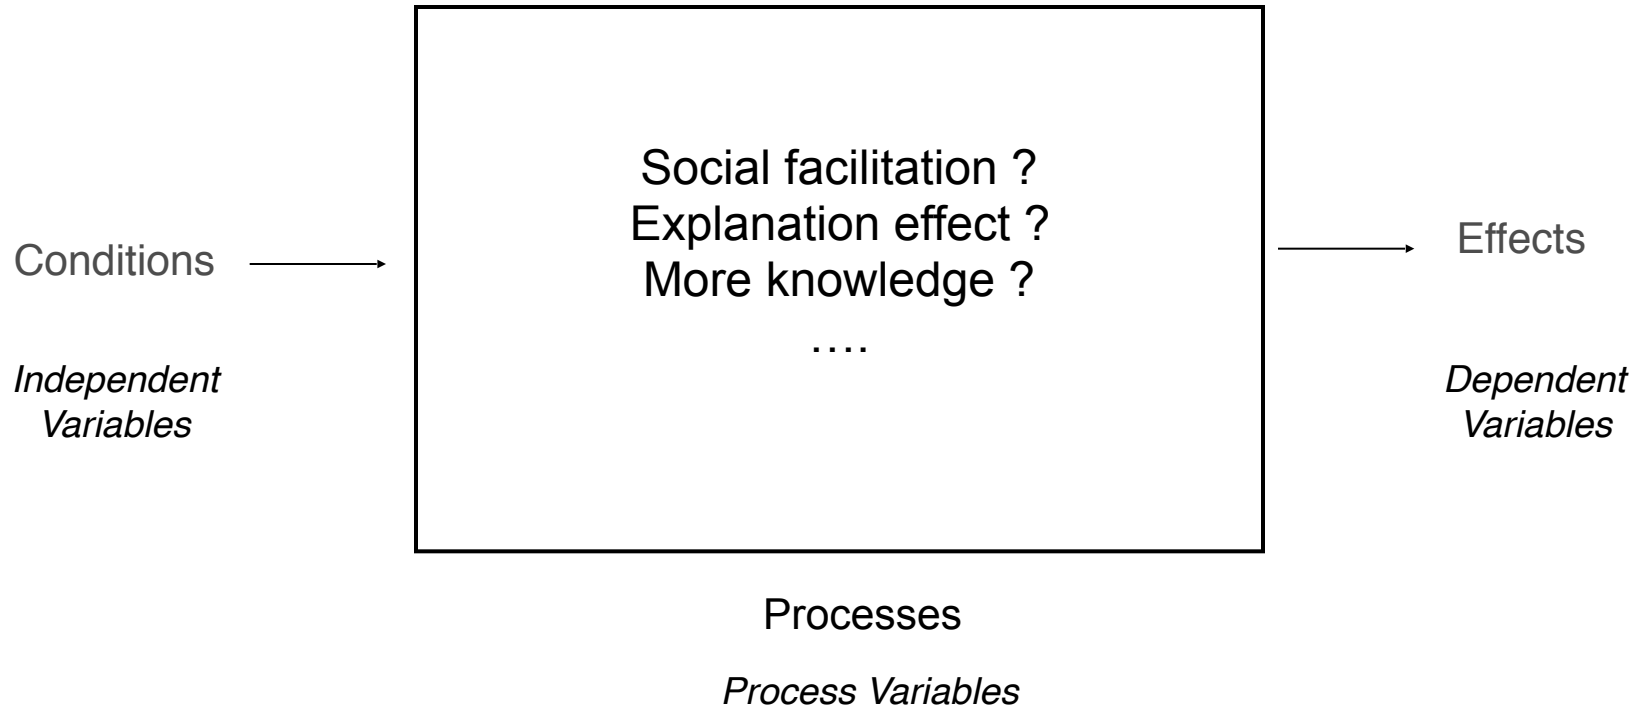

Conditions
*Independent
Variables*

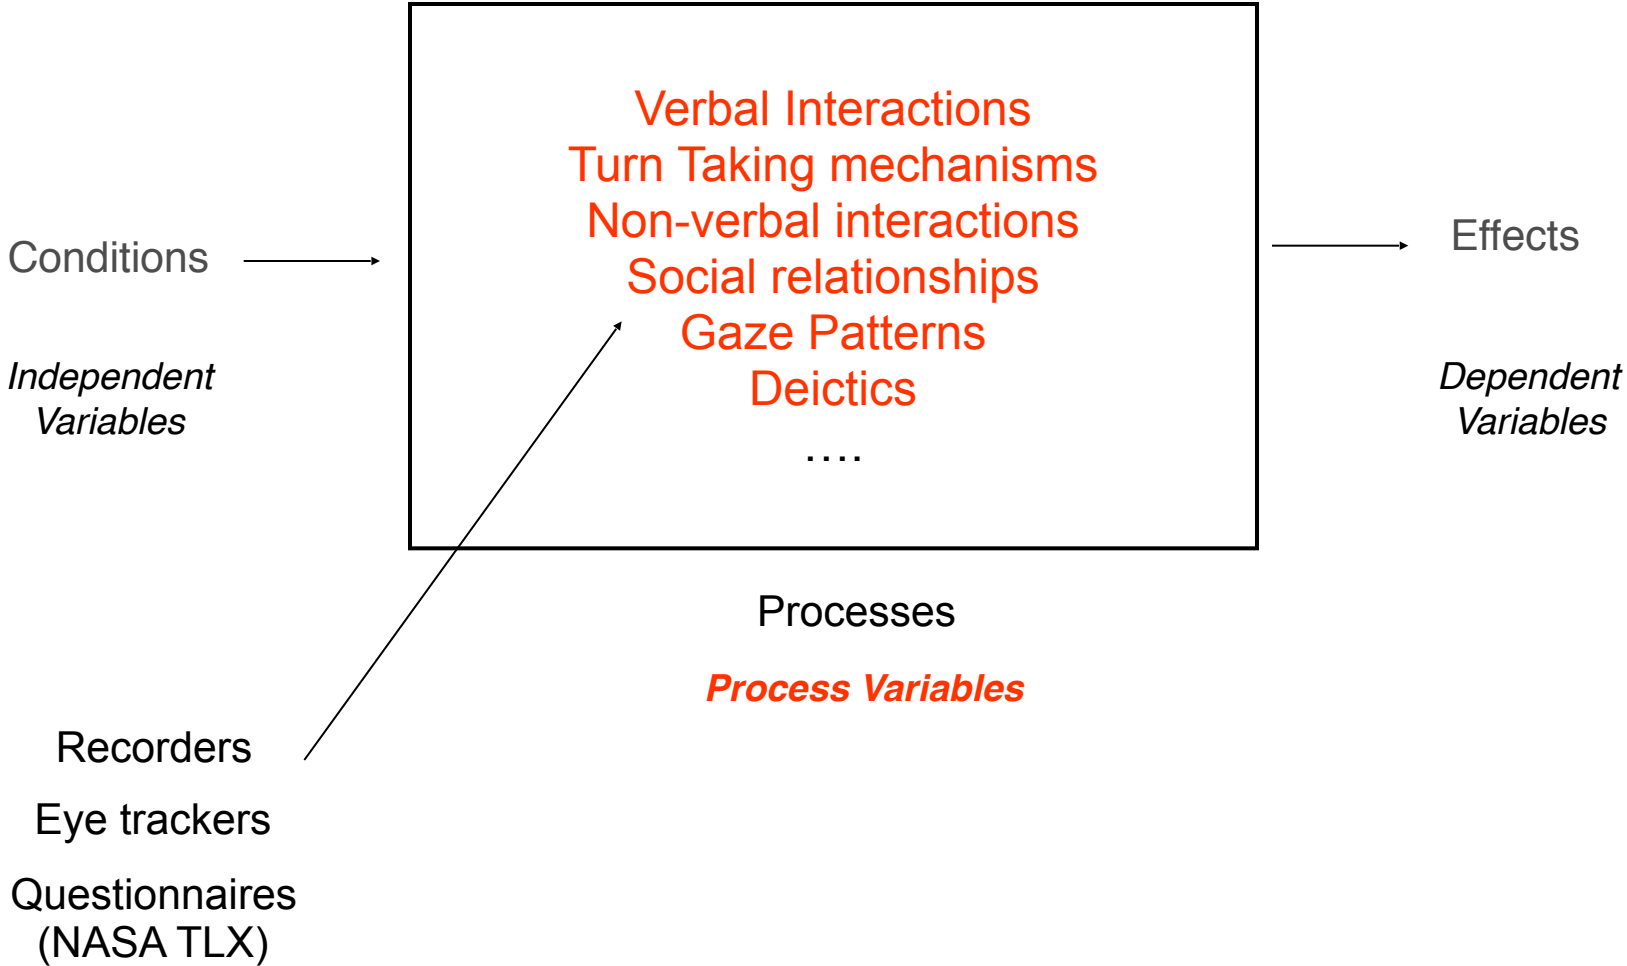

Effects
*Dependent
Variables*

Processes

3. Why are they better ?

3. Why are they better ?

Example : The effect of persistency of information

3. Why are they better ?

Conditions → Processes → Effects

Independent Variables → [Red Box with -] → Dependent Variables

Persistency of information ('vignettes')

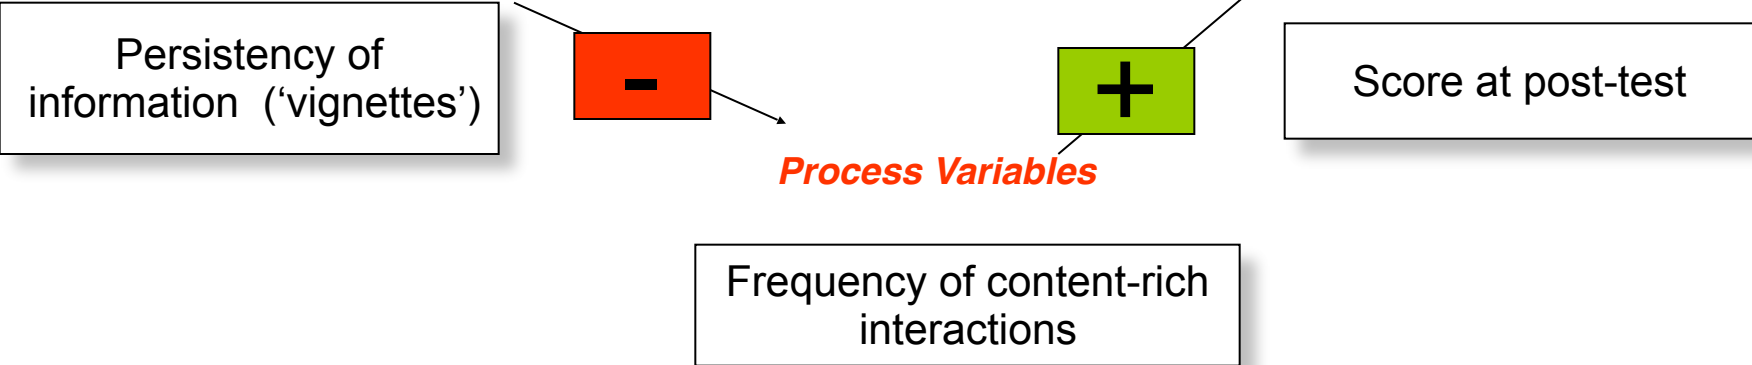

[Red Box with -]

[Green Box with +]

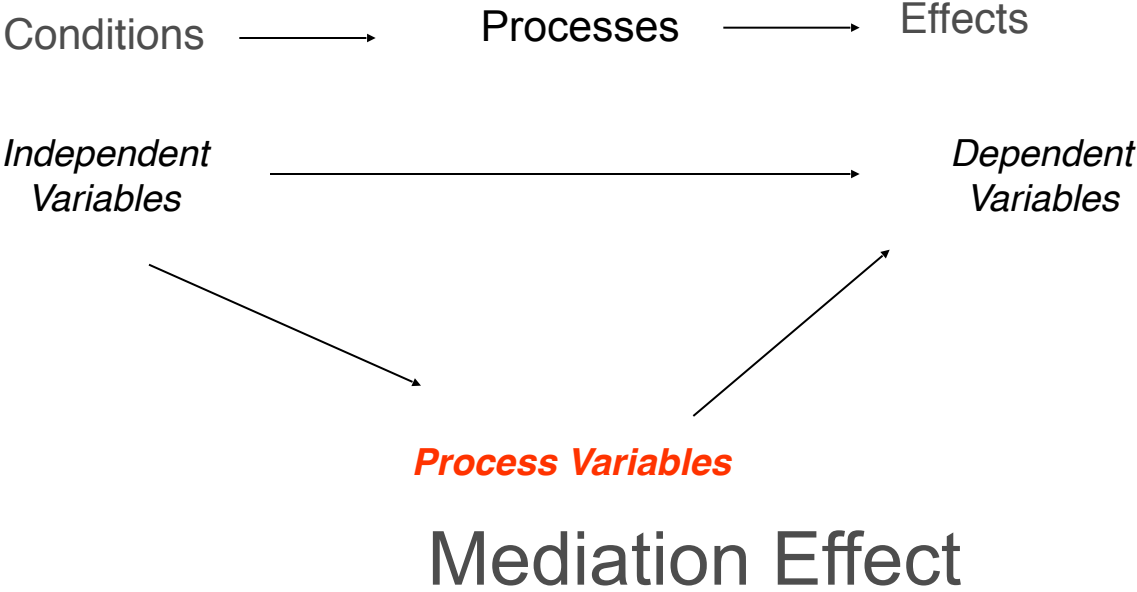

Score at post-test

Process Variables

Frequency of content-rich interactions

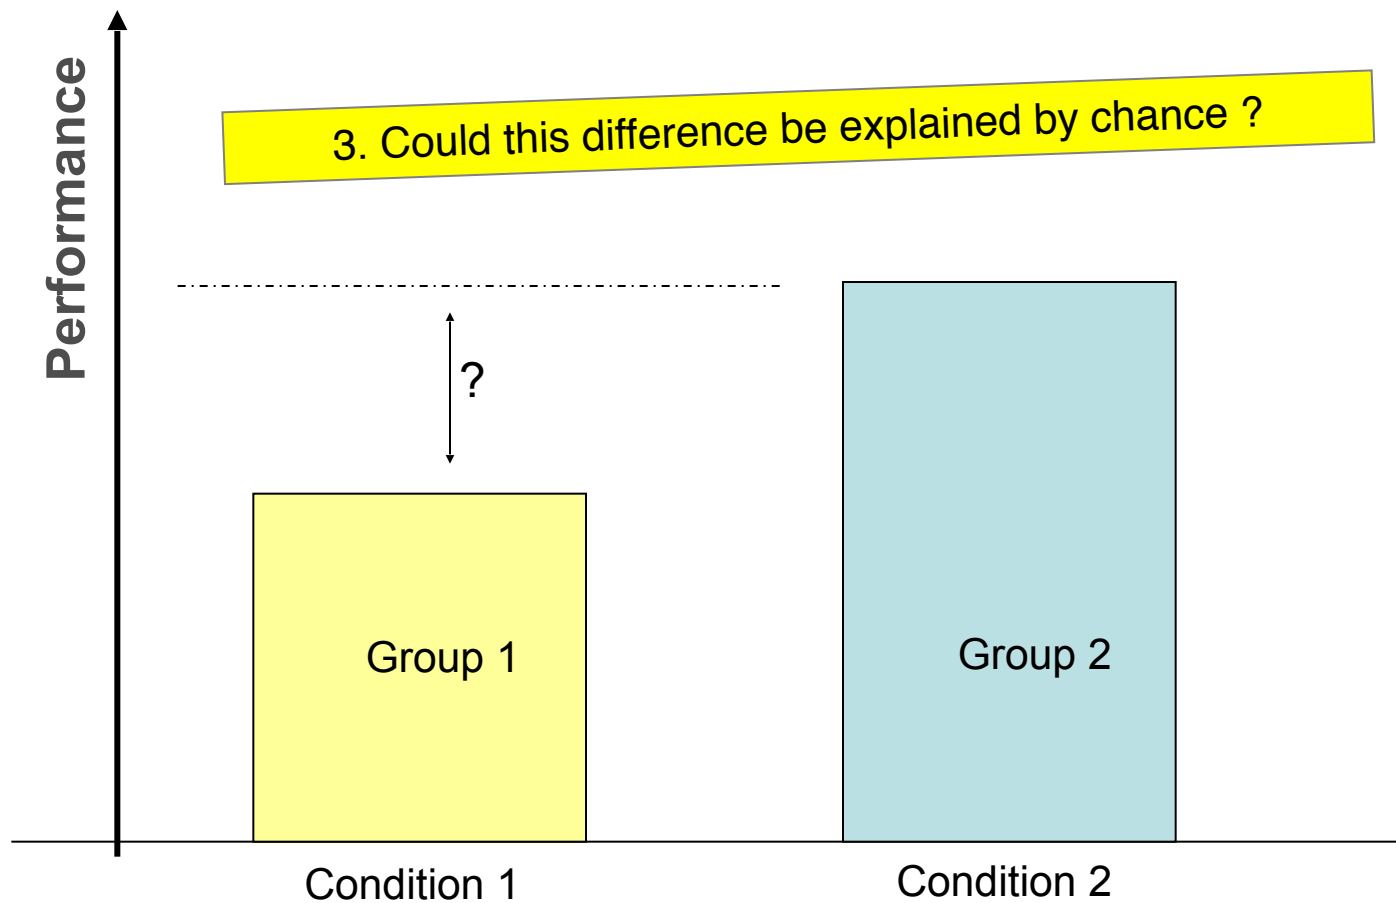

3. Why are they better ?

Research Sub Questions

Is it more effective to watch MOOCs
individually or in small teams ?

3. Could this difference be explained by chance ?

Is this difference in group means due to **sampling** or is it the effects of condition changes?

If group 2 had been in condition 1 and group 1 in condition 2, would group 2 still get a higher performance ?

Score

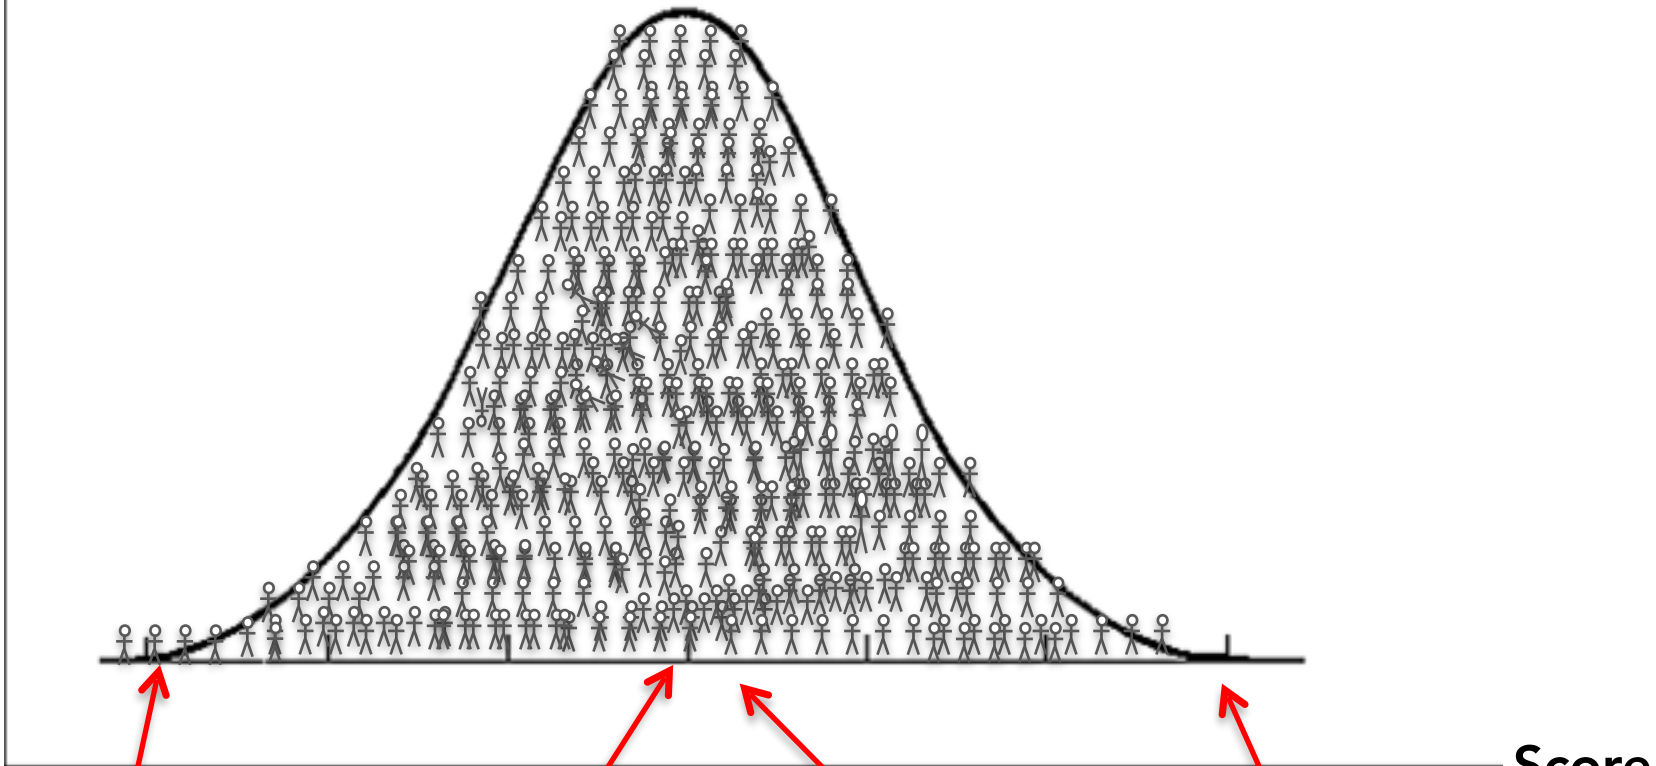

$$m = 37.2$$

$$m = 38.1$$

$$m = 2.8$$

Parobability

m = 2.8

m = 37.2

m = 38.1

m = 61

The sample size reduces the probability to get by chance a sample mean that is far from the population means

The differences of mean are the same, but which one is more significant ?

“Significant” does not mean “large” !

Age
Gender
Row in classroom

Summary

- Research Question To be answered by the experiment
- Hypothesis Expected results ($A > B$); an affirmation
- Independent variables What one varies between the conditions (or Factor)
- Modality Value of a factor
- Condition Set of (factor, modality) per group of subjects
- Control group The reference against which one will compare
- Dimension Number of factors
- Dependent variables How does one measure the effects ?
- Controlled variables Things you try to keep constant or to randomize
- Intermediate variables Explain the link from Independent to Dependent Variables
- “Significant” difference Probably ($<5\%$) not due to sampling error
- Interaction effect The effect of one IV on the DV depends upon another IV
- Between/Within subject Do subjects pass in one or several conditions ?
- Counterbalancing Inverting the order of conditions for within-subject plans
