

# *Motion Capture for full-body interaction*

***video1***

1. Background on full-body motion capture
  - Example of a film production
  - Example of real-time interaction
2. Posture reconstruction
  - Analytic IK
  - Jacobian-based IK
3. Collision avoidance
4. Other examples of full-body interaction

# 1. Background on full-body motion capture

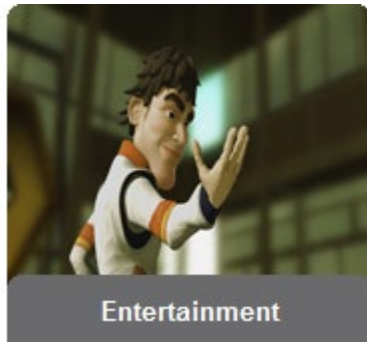

Main motivation for using marker-based motion capture systems: **precision**

Application fields (on-line and off-line):

**Entertainment:** Visual effect/animation, theme park (e.g. Pharaoh tomb)

**Training and Simulation:** Real-time mock-up, evaluation of stress

**Movement science:** measuring 3D subject's performance.

# 1. Background on full-body motion capture (2)

- **Motion Capture (mocap)**

- Lee Harrison: first “data suit” for TV production in 1967 : the posture is measured with exoskeleton and potentiometers [S 1998]
- Still some exoskeleton on the market to measure posture [E2008] but rather invasive/cumbersome. Limited precision.

Medialab Paris [S 1998]

# 1. Background on full-body motion capture (3)

- **Occlusion-free technologies:**
  - **Magnetic** sensors do not suffer from occlusion but from field distortions due to metallic elements in the environment (e.g. Floor)
    - 6D sensor providing position & orientation

- Datasuit with **Inertial Measurement Units (IMU)** : no occlusion but drift over time

- *Acceleration*
- *Angular velocity*
- *Magnetometer*
- *to recover:*
  - *3D position*
  - *3D orientation*

Xsense MVN

# 1. Background on full-body motion capture (4)

- **Optical technologies:**
  - **Passive** optical markers with IR cameras (VICON):
    - used both in film, game, VR, and orthopaedics. Precise but expensive. Weakness in real-time in case of occlusion: the system loses the markers IDs.

Markers on feet, hands, head and torso [Artanim real-time Demo 2015]

## Example of a film production (from Renaissance DVD)

*Simultaneous tracking of body posture  
and cloth movement*

*Need of minimal and hollow decor elements  
(called props) to minimize occlusion*

## Example of a film production (from Renaissance DVD)

### *Simultaneous body, head and eye direction (gaze) tracking*

*Camera filming the reflexion of the eye in the glass with IR filter*

*The eye direction can be expressed in the head Coordinate system*

*IR light*

[film «Renaissance»2006]

*The user is practicing a task in the CAVE (right) while an ergonomist evaluates the movement through an additional screen with a third person viewpoint.*

# 1. Background on full-body motion capture (5)

- **Optical technologies**
  - **Active** optical markers with IR camera (Phasespace), The system can recognize active markers even after occlusion

*LEDs*

*Dimensions: 20 mm x 14 mm x 3.2 mm*

*Weight: 4.5 grams*

*Each LED modulates at a unique frequency resulting in a unique digital ID. LEDs are available in Red visible and Infra-red versions.*

*Cameras*

*Dimensions: 108 mm x 92 mm x 57 mm*

*Weight: 380 grams*

*Each camera achieves an Optical Resolution of 3600 x 3600 (12 Megapixel) using two linear detectors with 16-bit dynamic range. Onboard processors produce an impressive Subpixel Resolution of 30,000 x 30,000 at 480 Hz.*

# 1. Background on full-body motion capture (6)

- **Low-cost active optical inside-out tracking technologies [Lighthouse]**
  - **Active emitters: 60hz IR pulses** (HTC lighthouse technology using 1-2 base stations)
  - Numerous **sensors** embedded on a range of devices: HMD, controller, tracker
  - IMU is used in case of occlusion
  - IMU drift is reset at 60Hz
  - Delivers position and orientation provided enough sensors detect the IR signal from base station
  - Scalable with V2.0

## Keys tasks of a real-time full-body mocap system:

- Acquisition of the 3D location of the markers (or sensors)
- Body posture reconstruction from the cloud of 3D points (or set of tracked devices)
- High end: need to combine posture reconstruction with collision avoidance
