

Principles of Computer Systems: Naming

Prof. Katerina Argyraki

School of Computer & Communication Sciences

Introduction

A **name** is a way to refer to a **resource**

For efficient **communication** and **organization**

For **indirection**

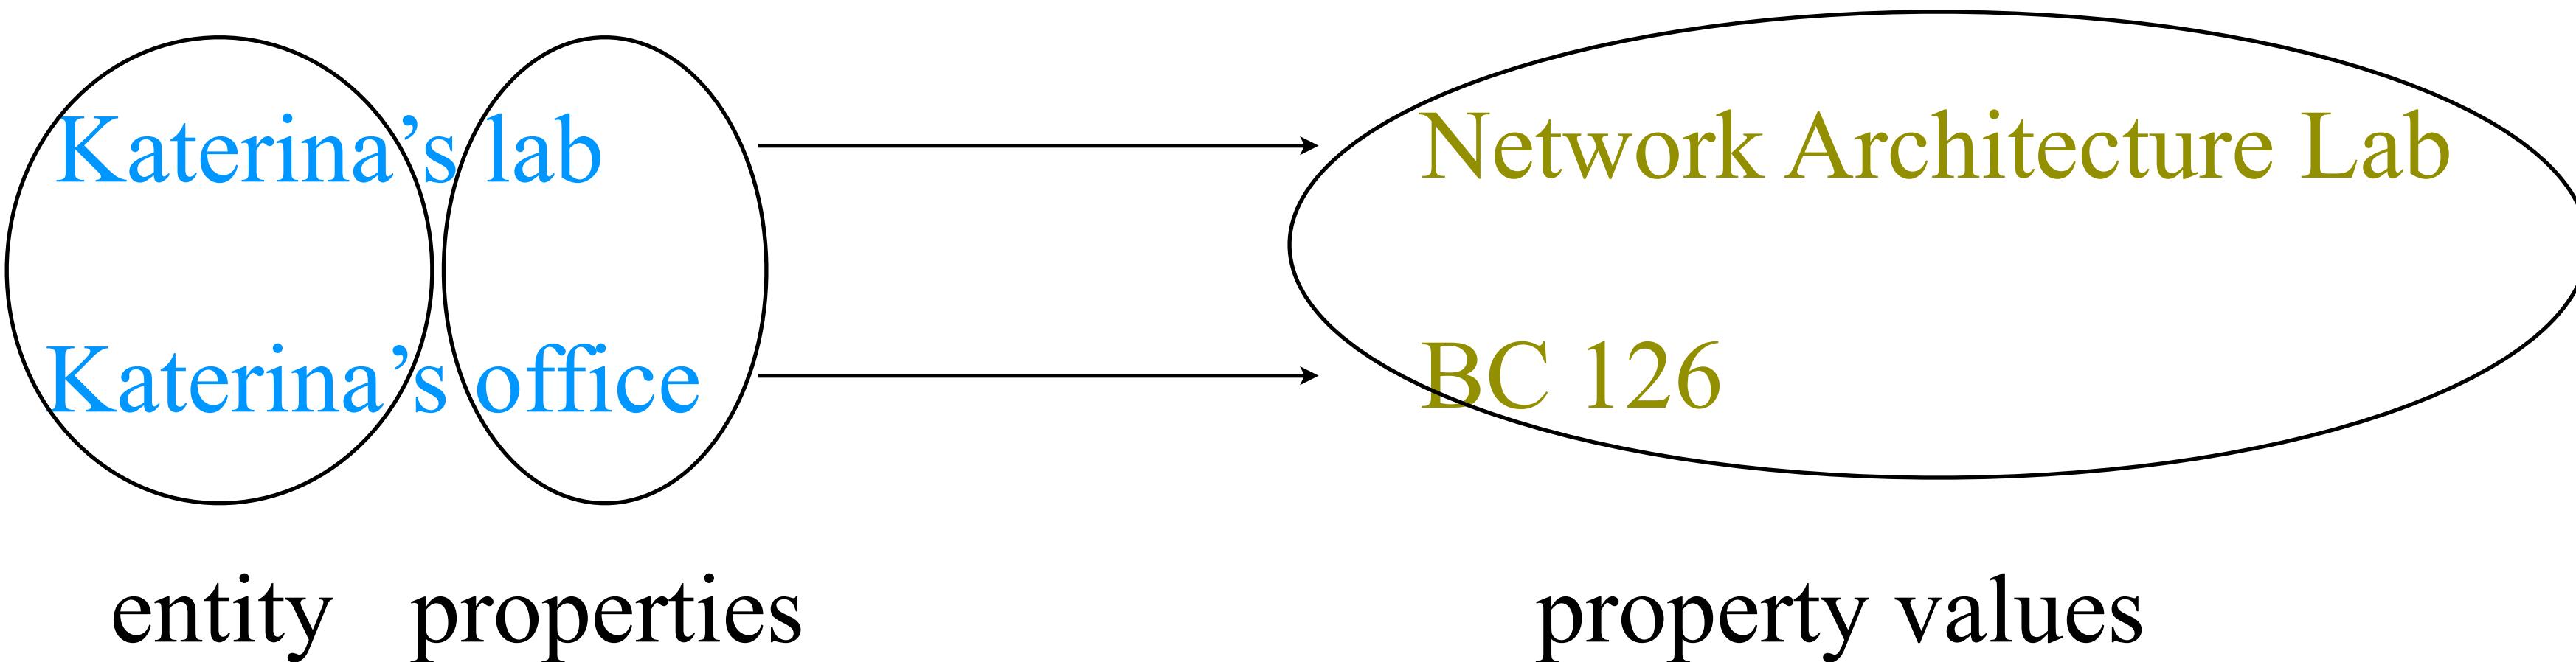

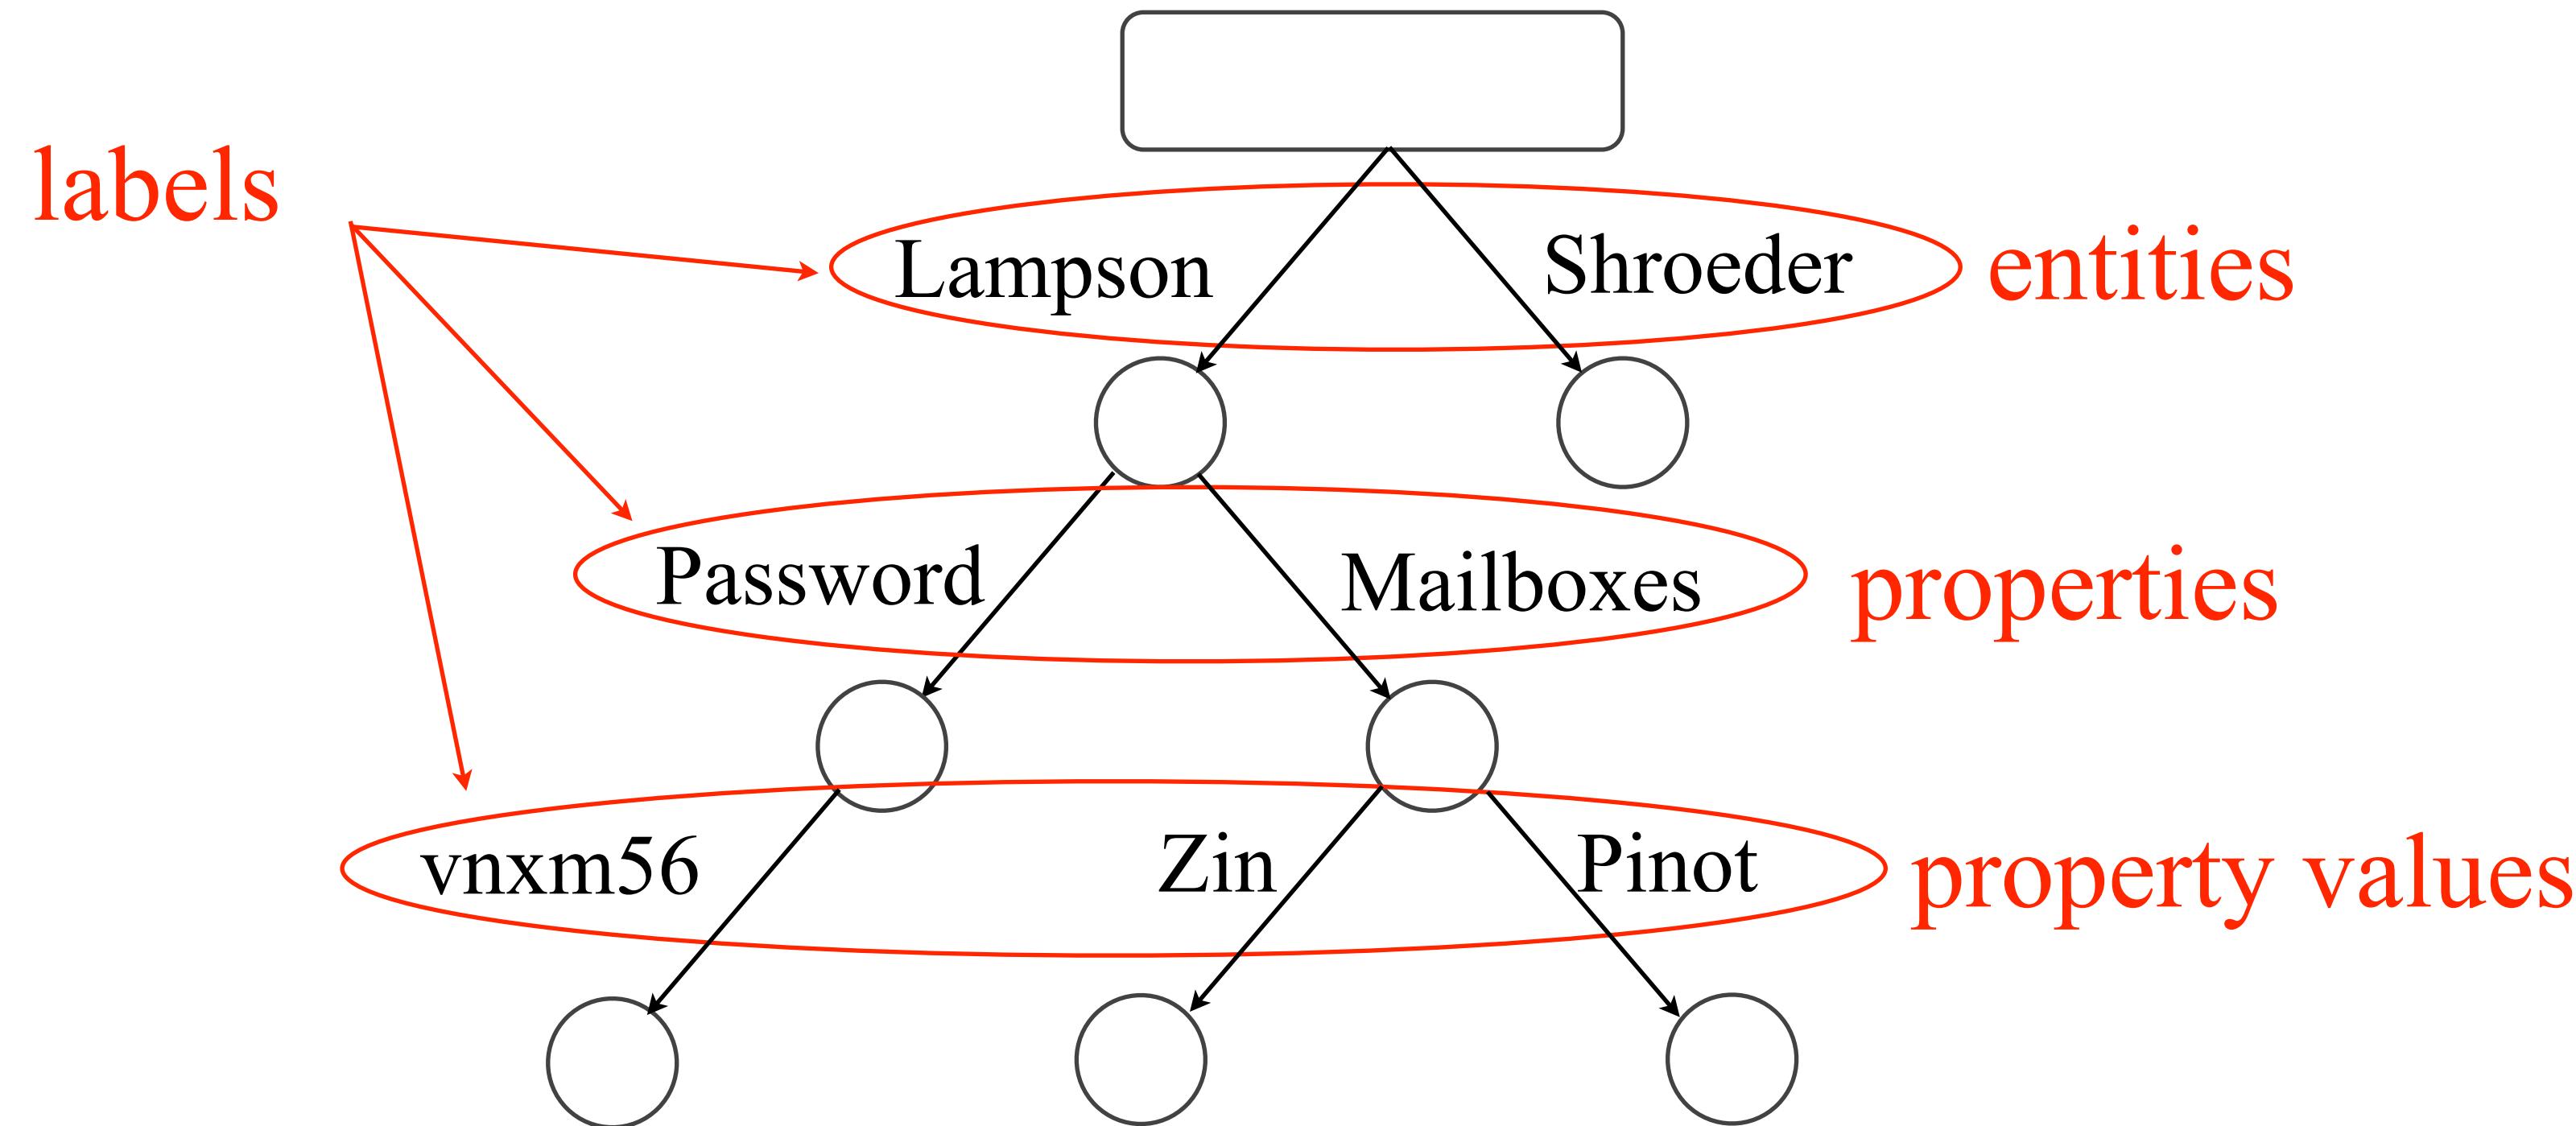

Name types

- **Private**: unique within a context
 - *e.g., a private IP address is unique within an organization*
- **Global**: unique across contexts
 - *e.g., a global IP address is unique within the Internet*
- **Hierarchical**: name relationship implies value relationship
 - *e.g., two IP addresses sharing the same prefix*
- **Flat**: name relationship implies nothing
 - *e.g., content IDs in Peer-to-Peer networks*

Designing a Global Name Service

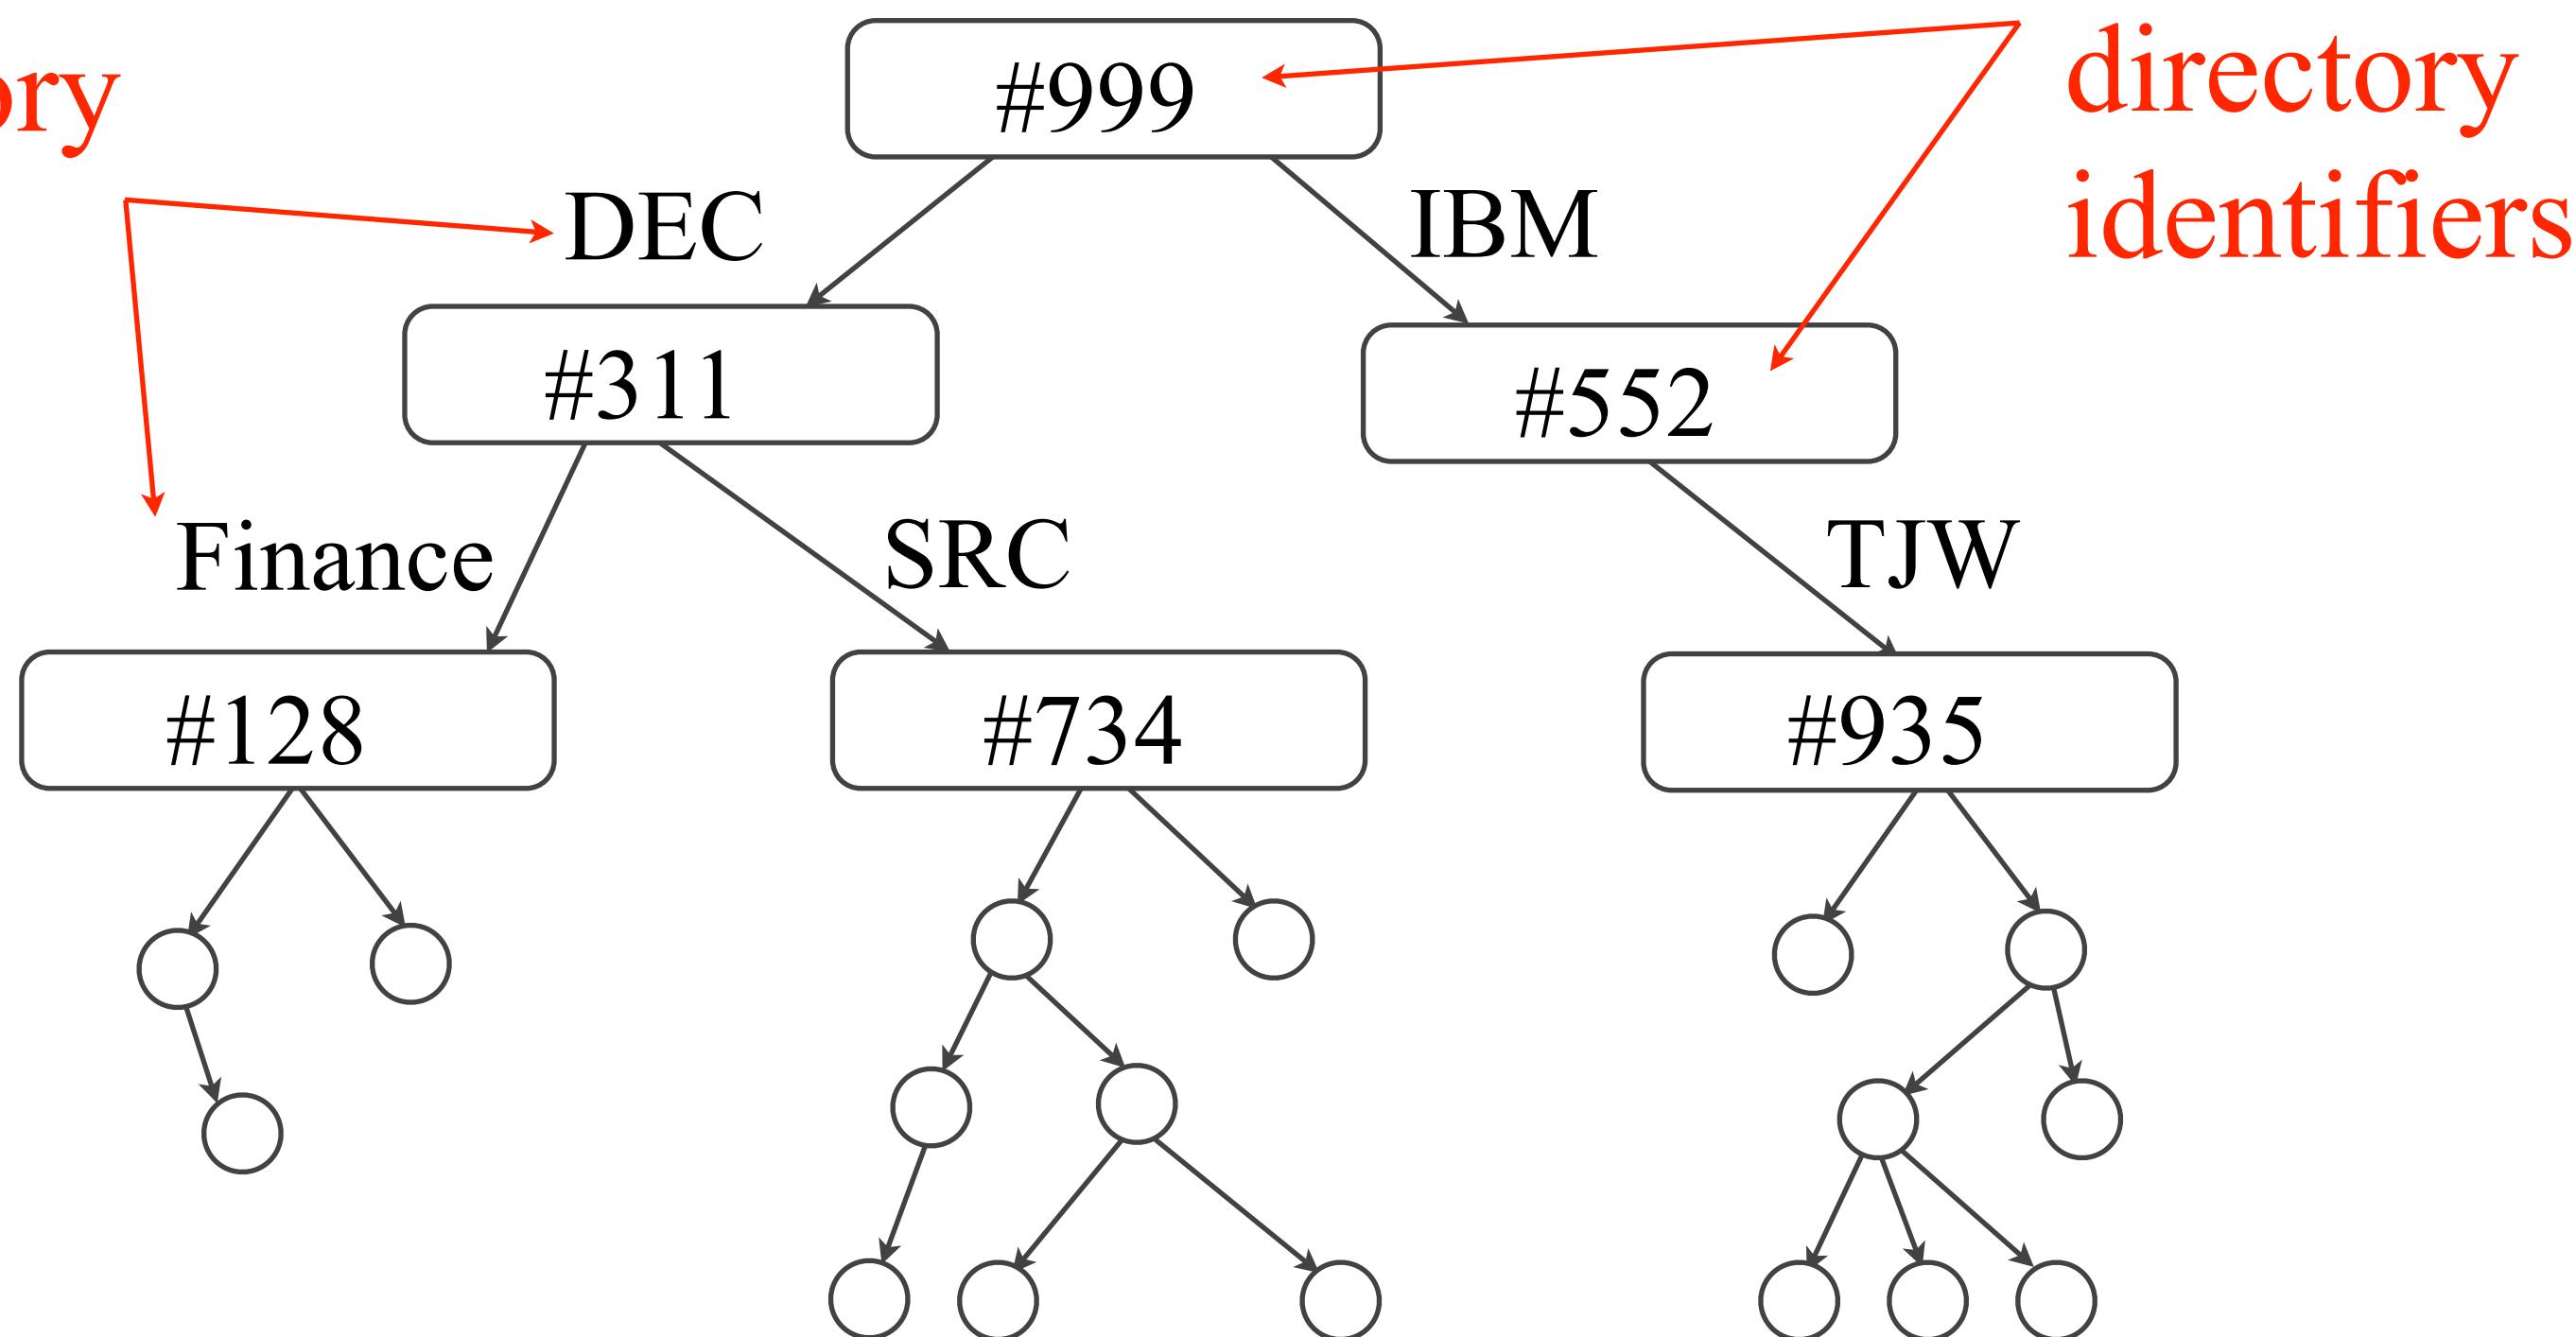

- A name service maps **names** to **values**
- In this paper, a name is **hierarchical**, typically consisting of an entity and a property

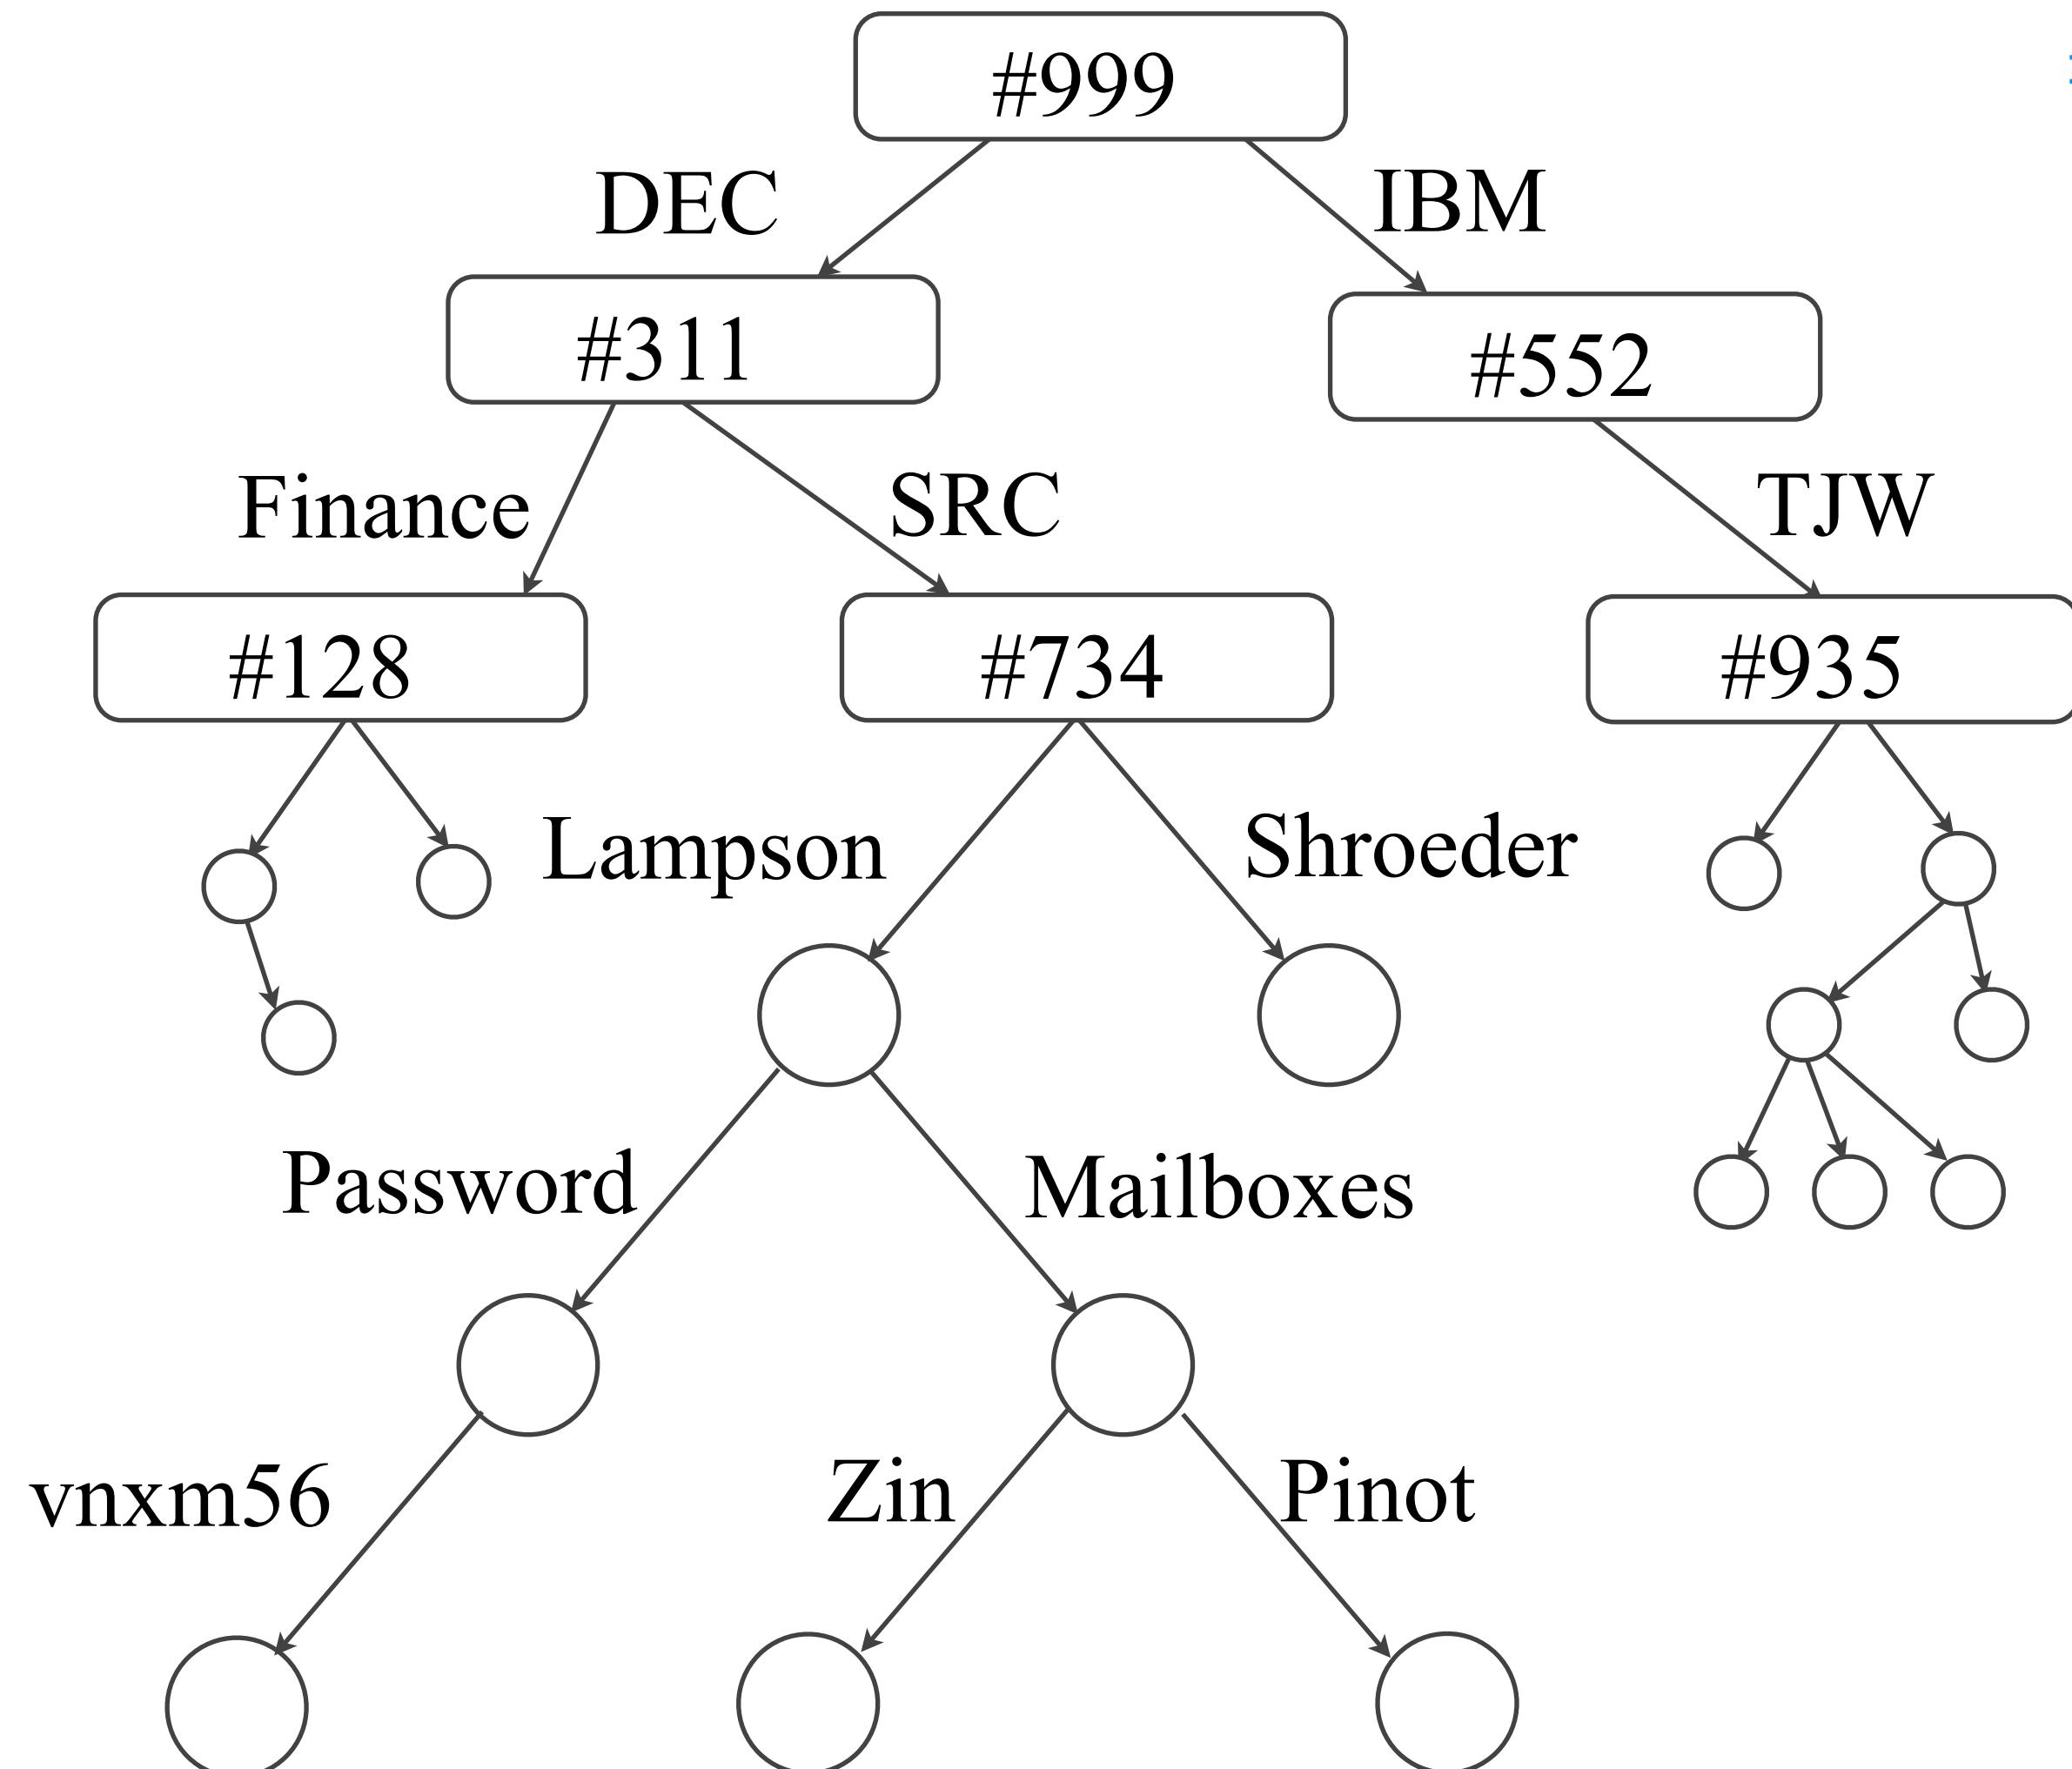

Design goal #1: scalability

- Must support an **arbitrary** number of names + administrative organizations

local
directory
names

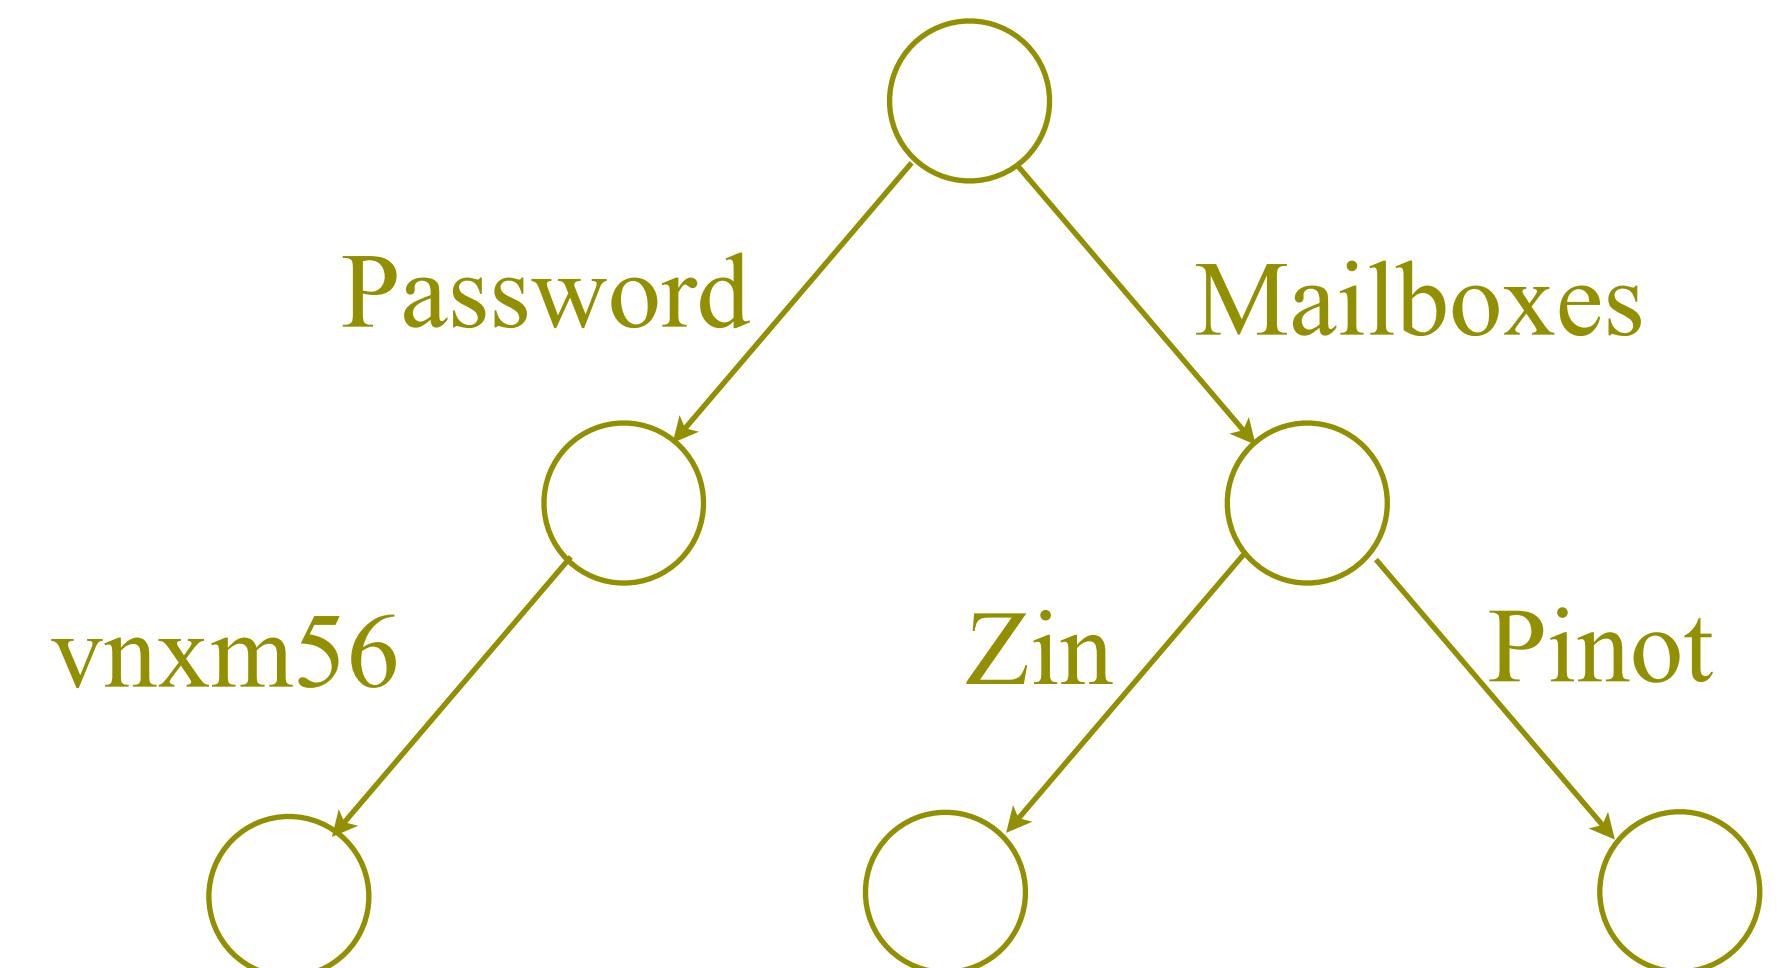

global
directory
identifiers

#999/DEC/SRC/Lampson/Password

vn xm56

#999/DEC/SRC/Lampson

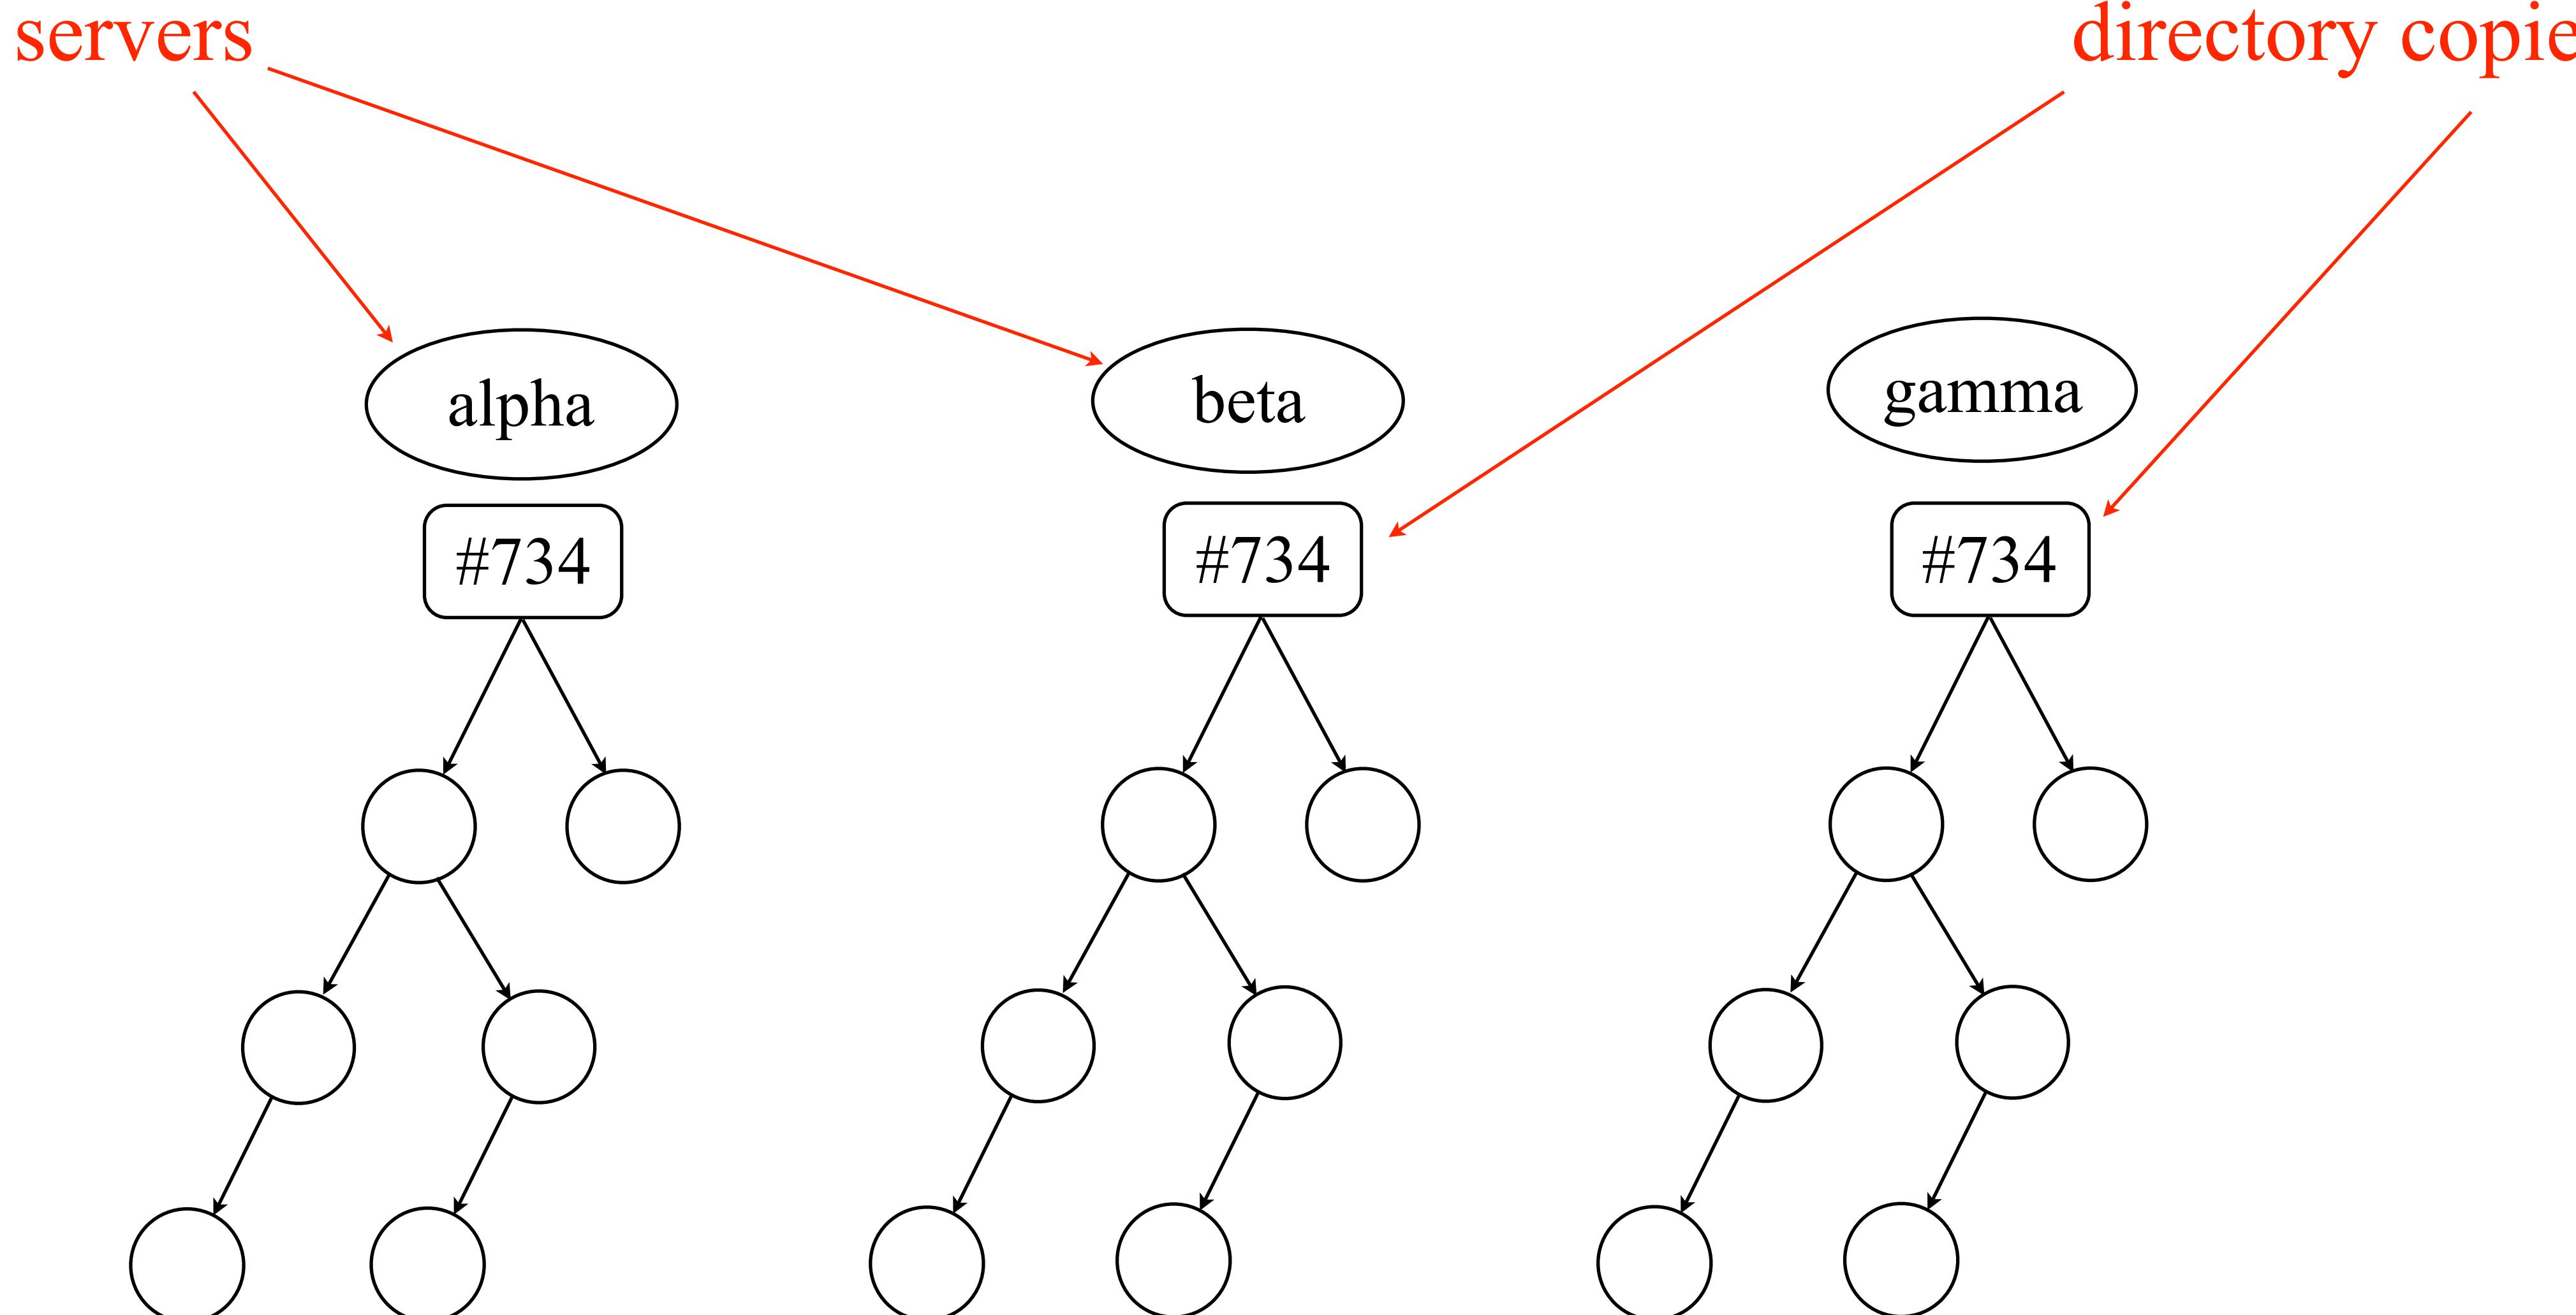

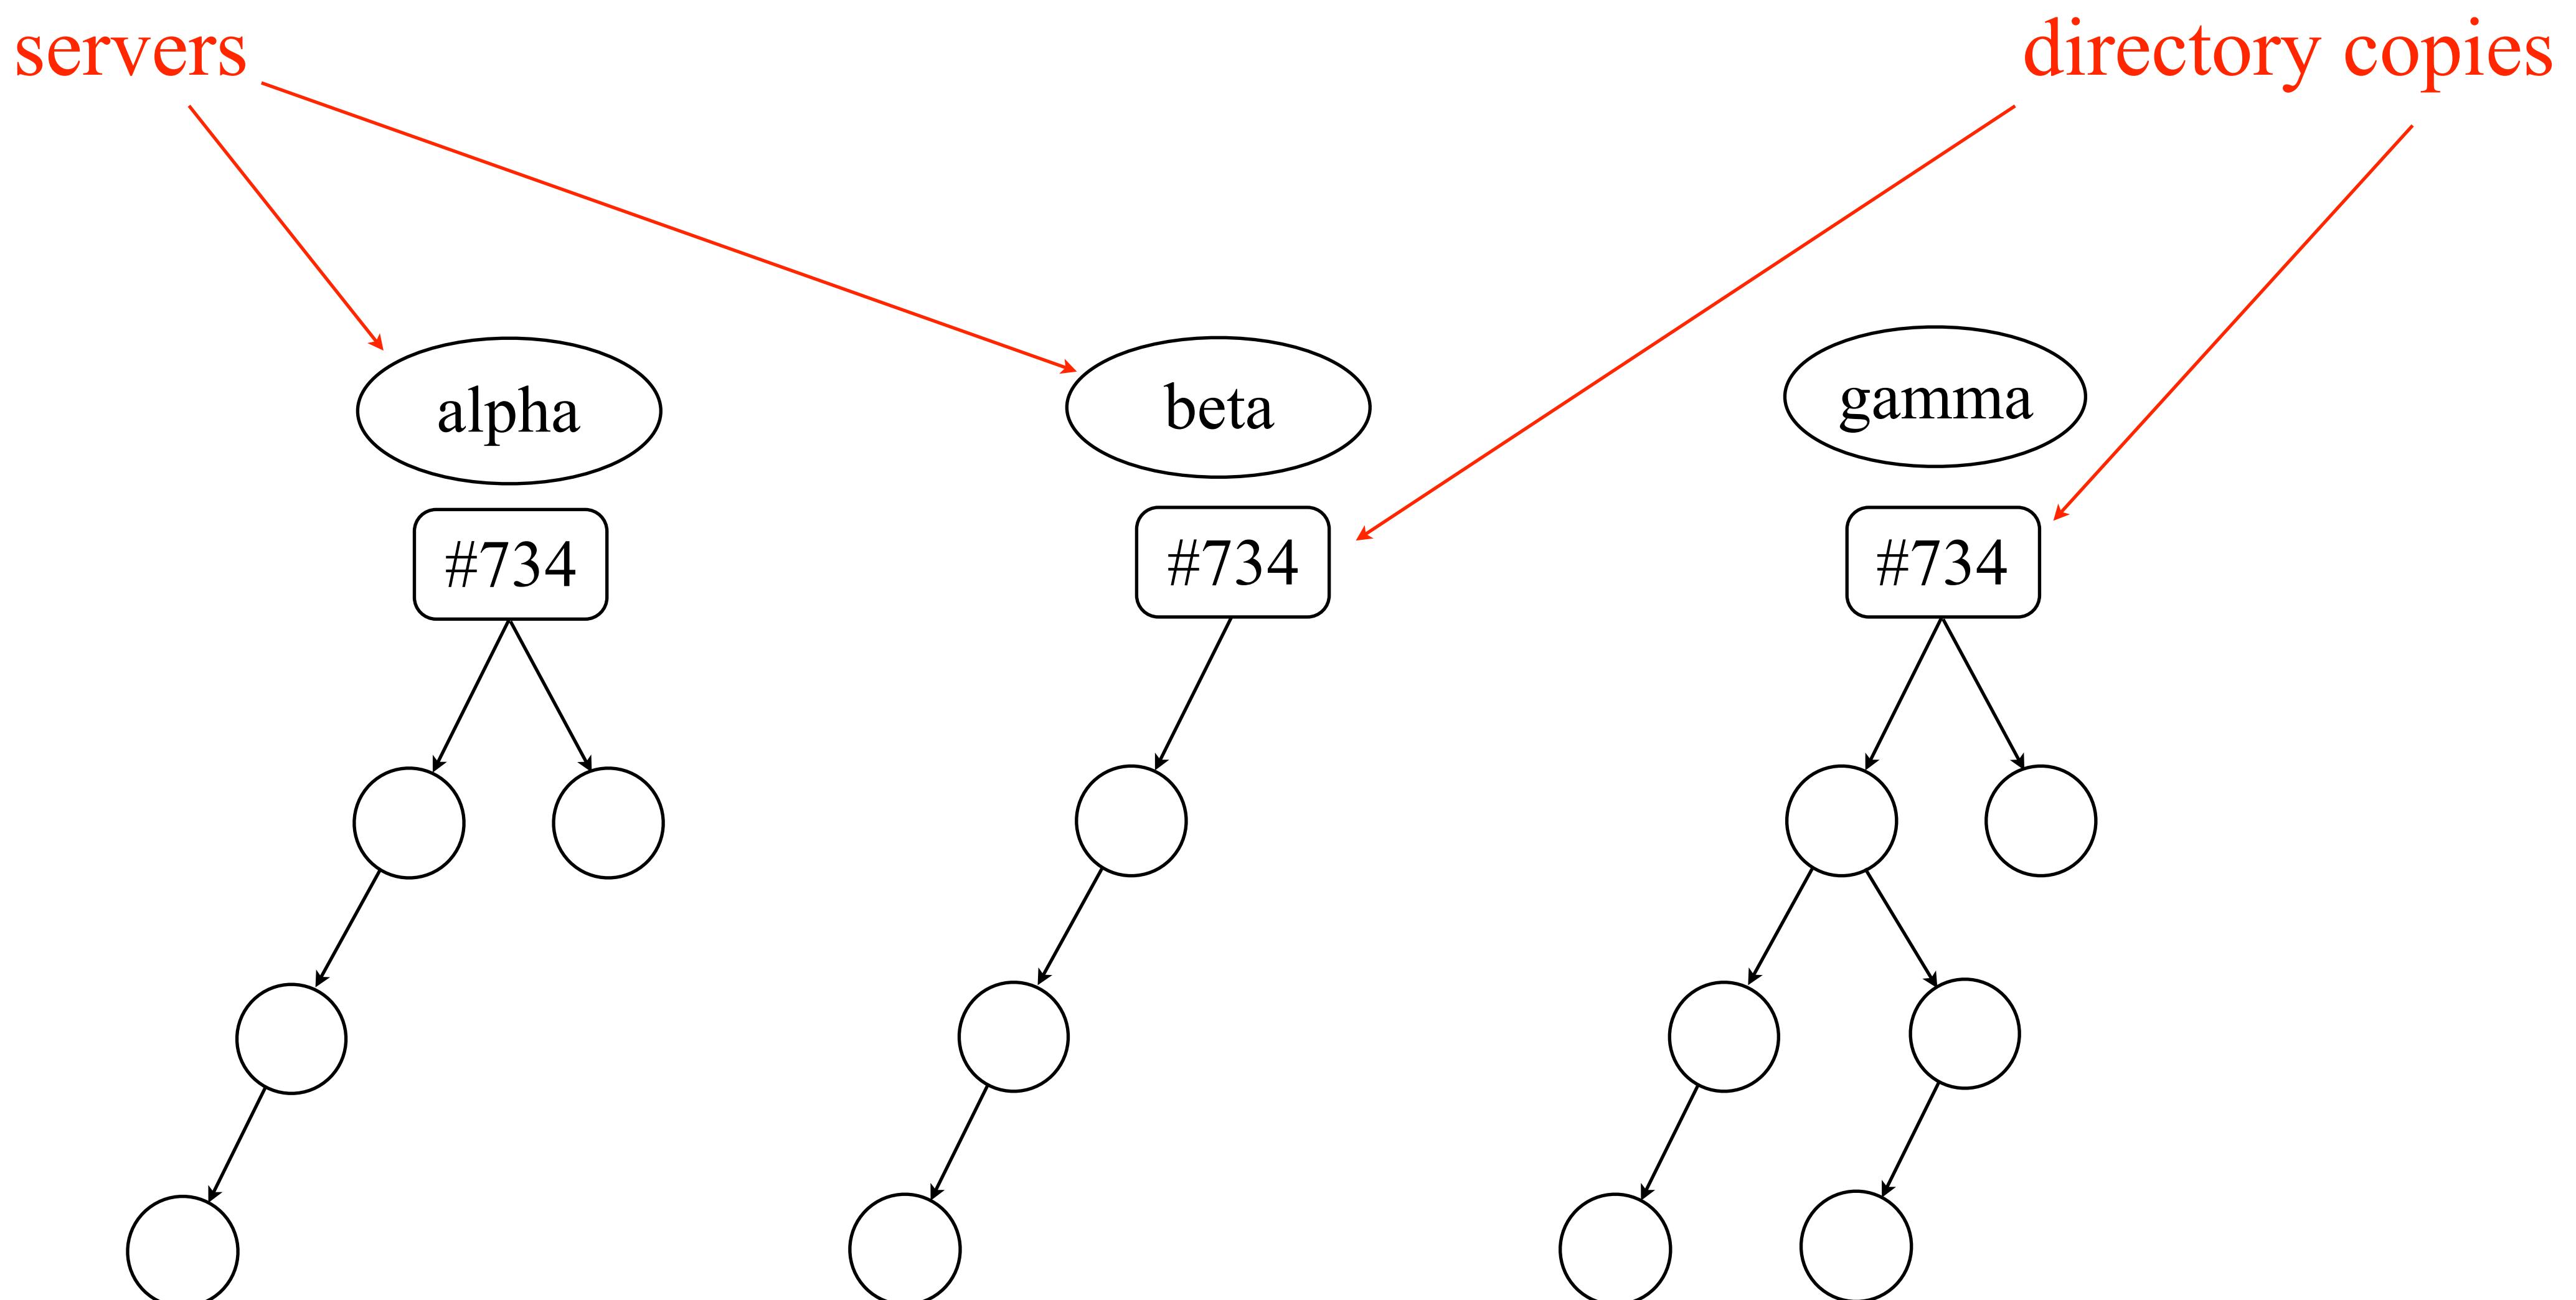

Design goal #1: scalability

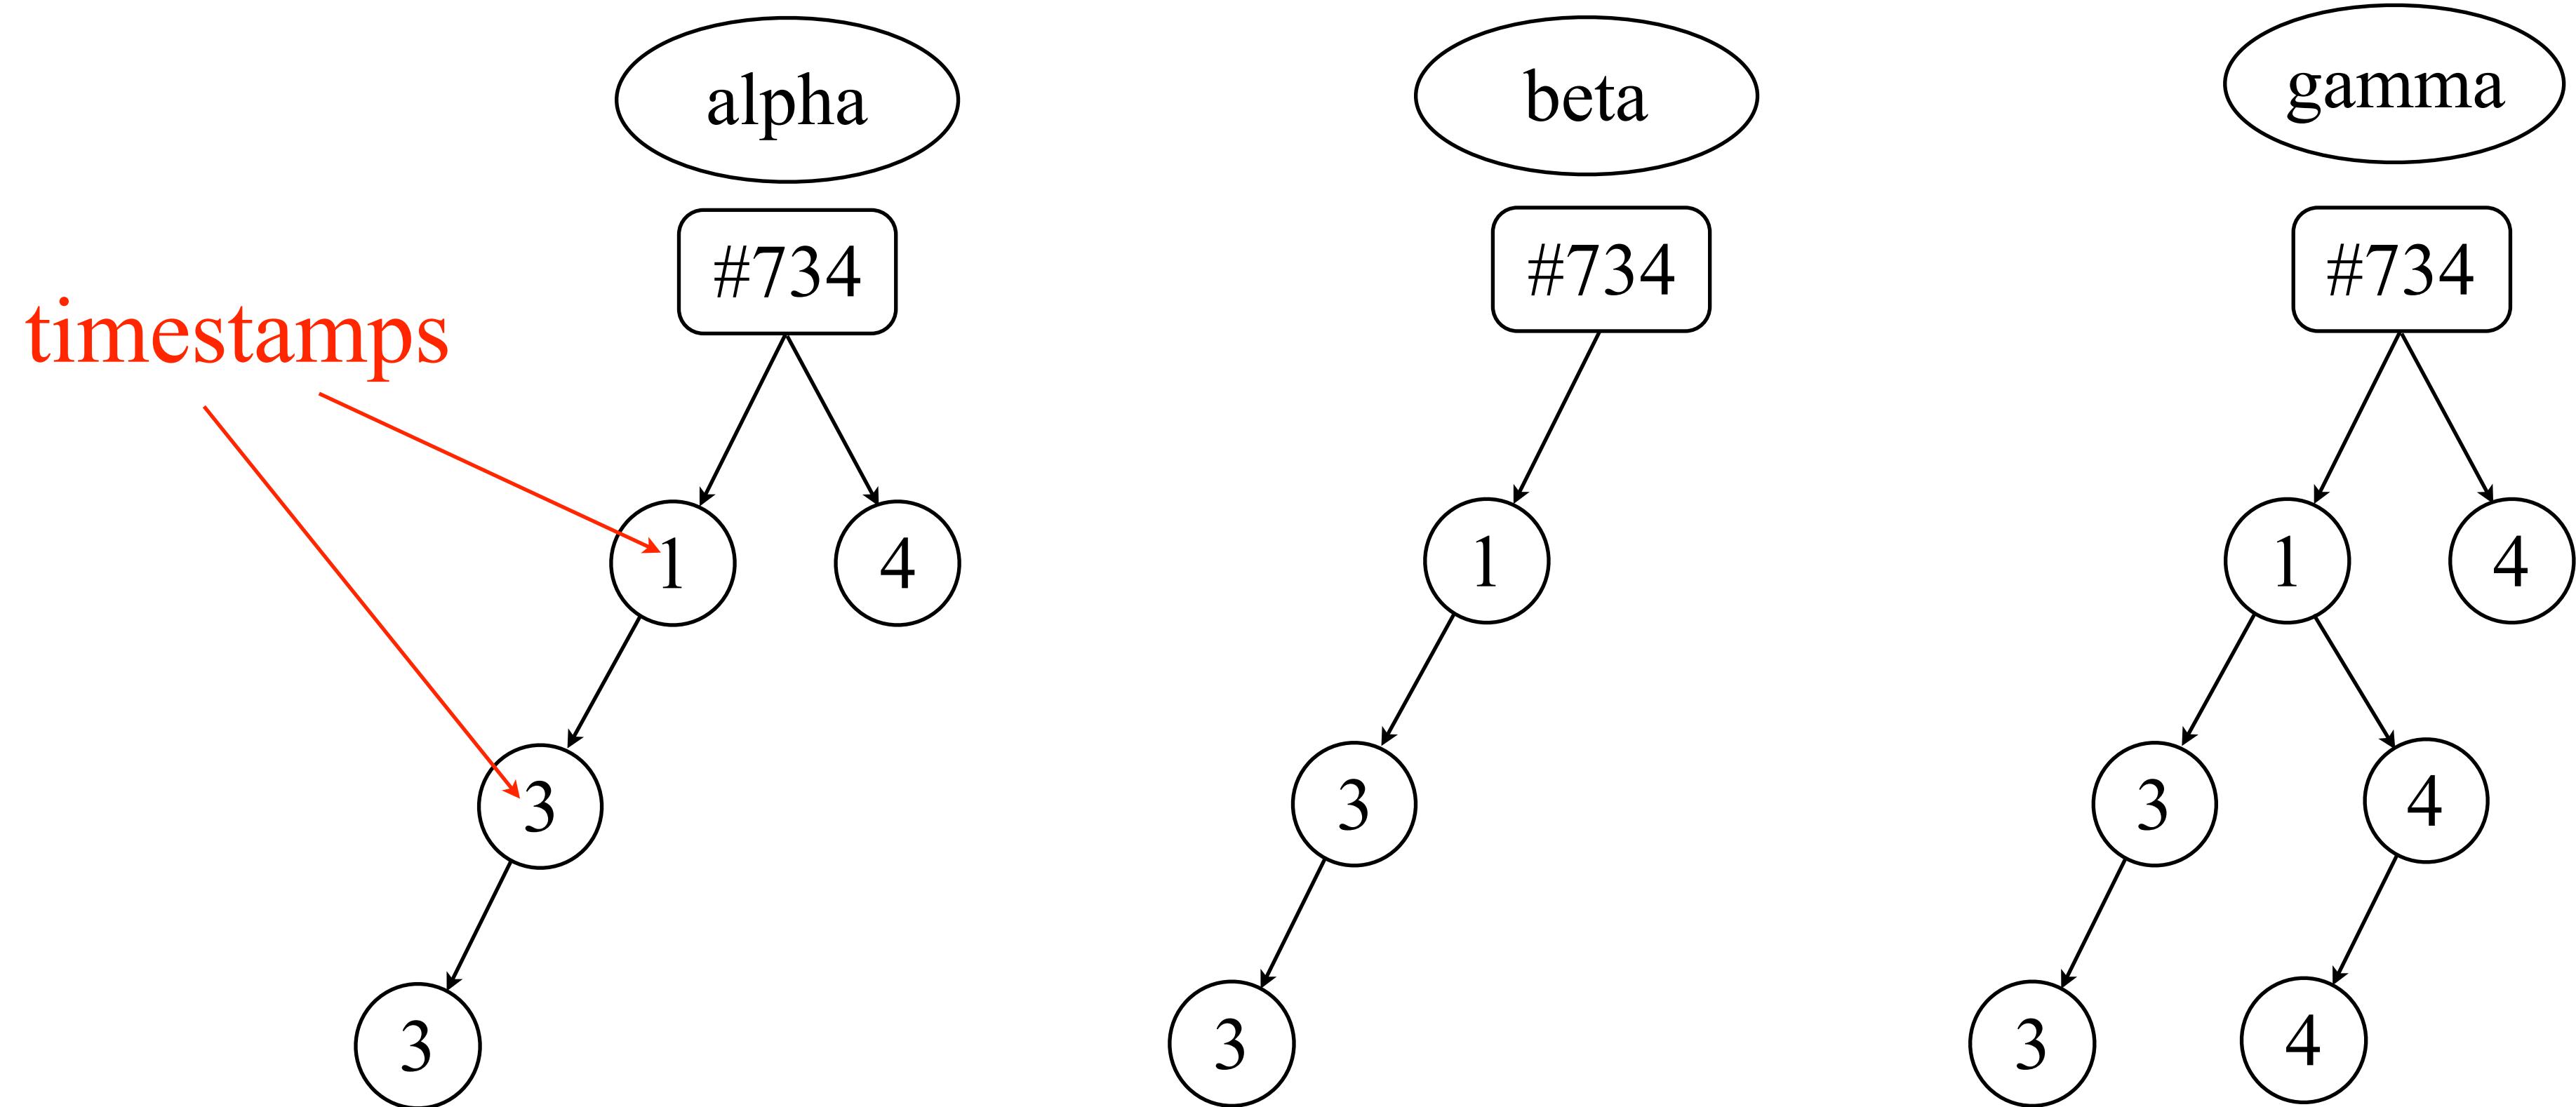

- Achieved through a **hierarchy** of directories, each potentially owned by a different entity, each with a **private namespace**

Design goal #2: fault tolerance

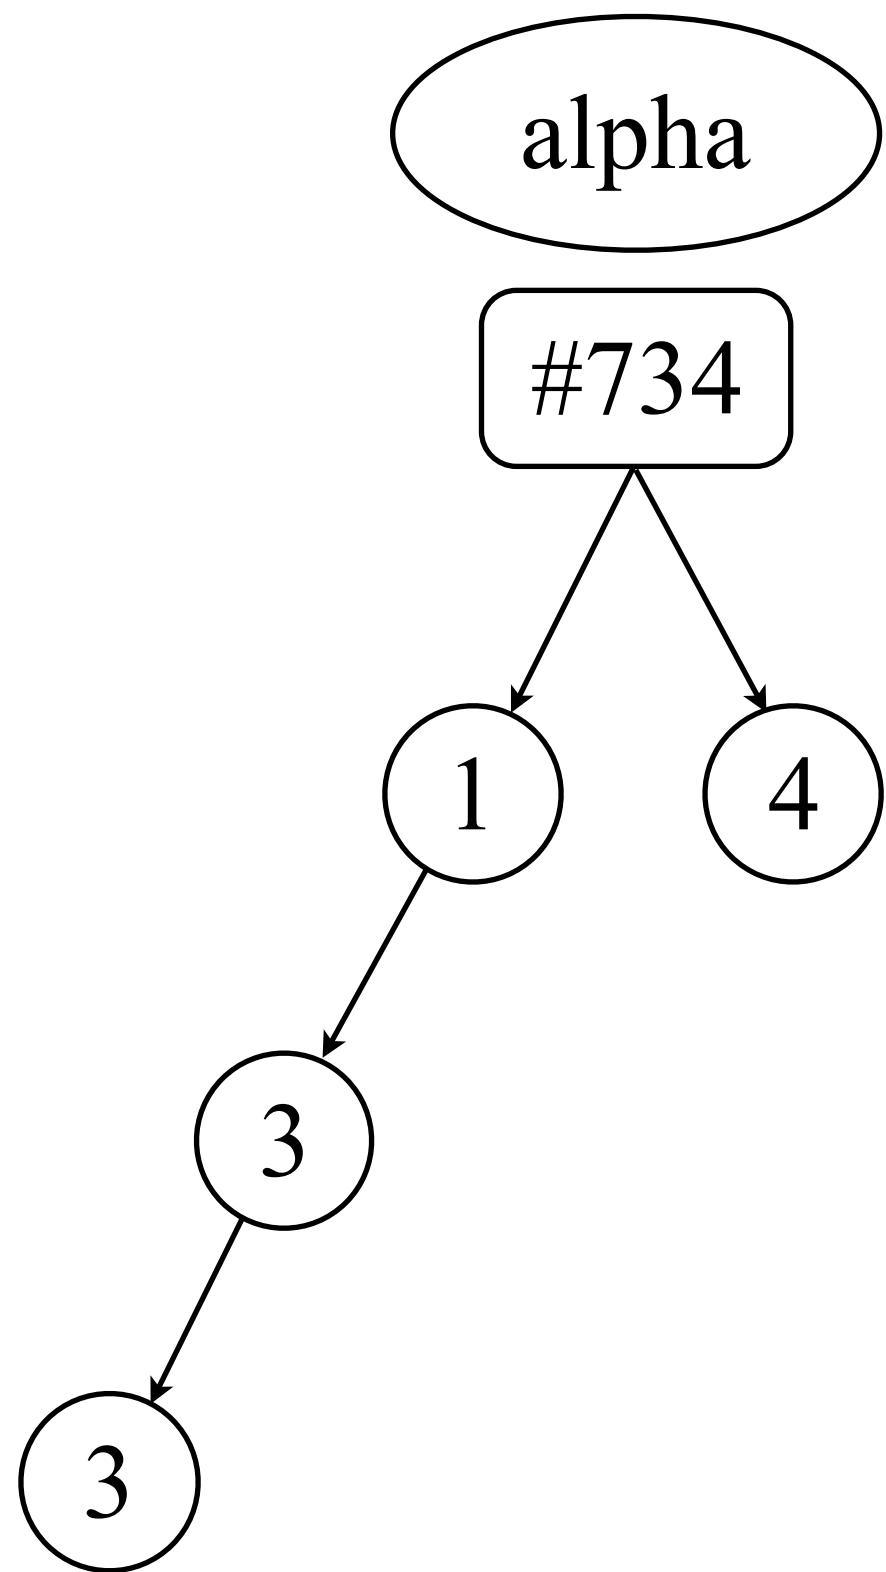

- The service should offer the same functionality even if N of its servers fail

Names

#999/DEC/SRC/Lampson/Password

#999/DEC/DR

#311, {*delta, omega*}

Values

Names

#999/DEC/SRC/Lampson/Password

#999/DEC/DR

#311/SRC/DR

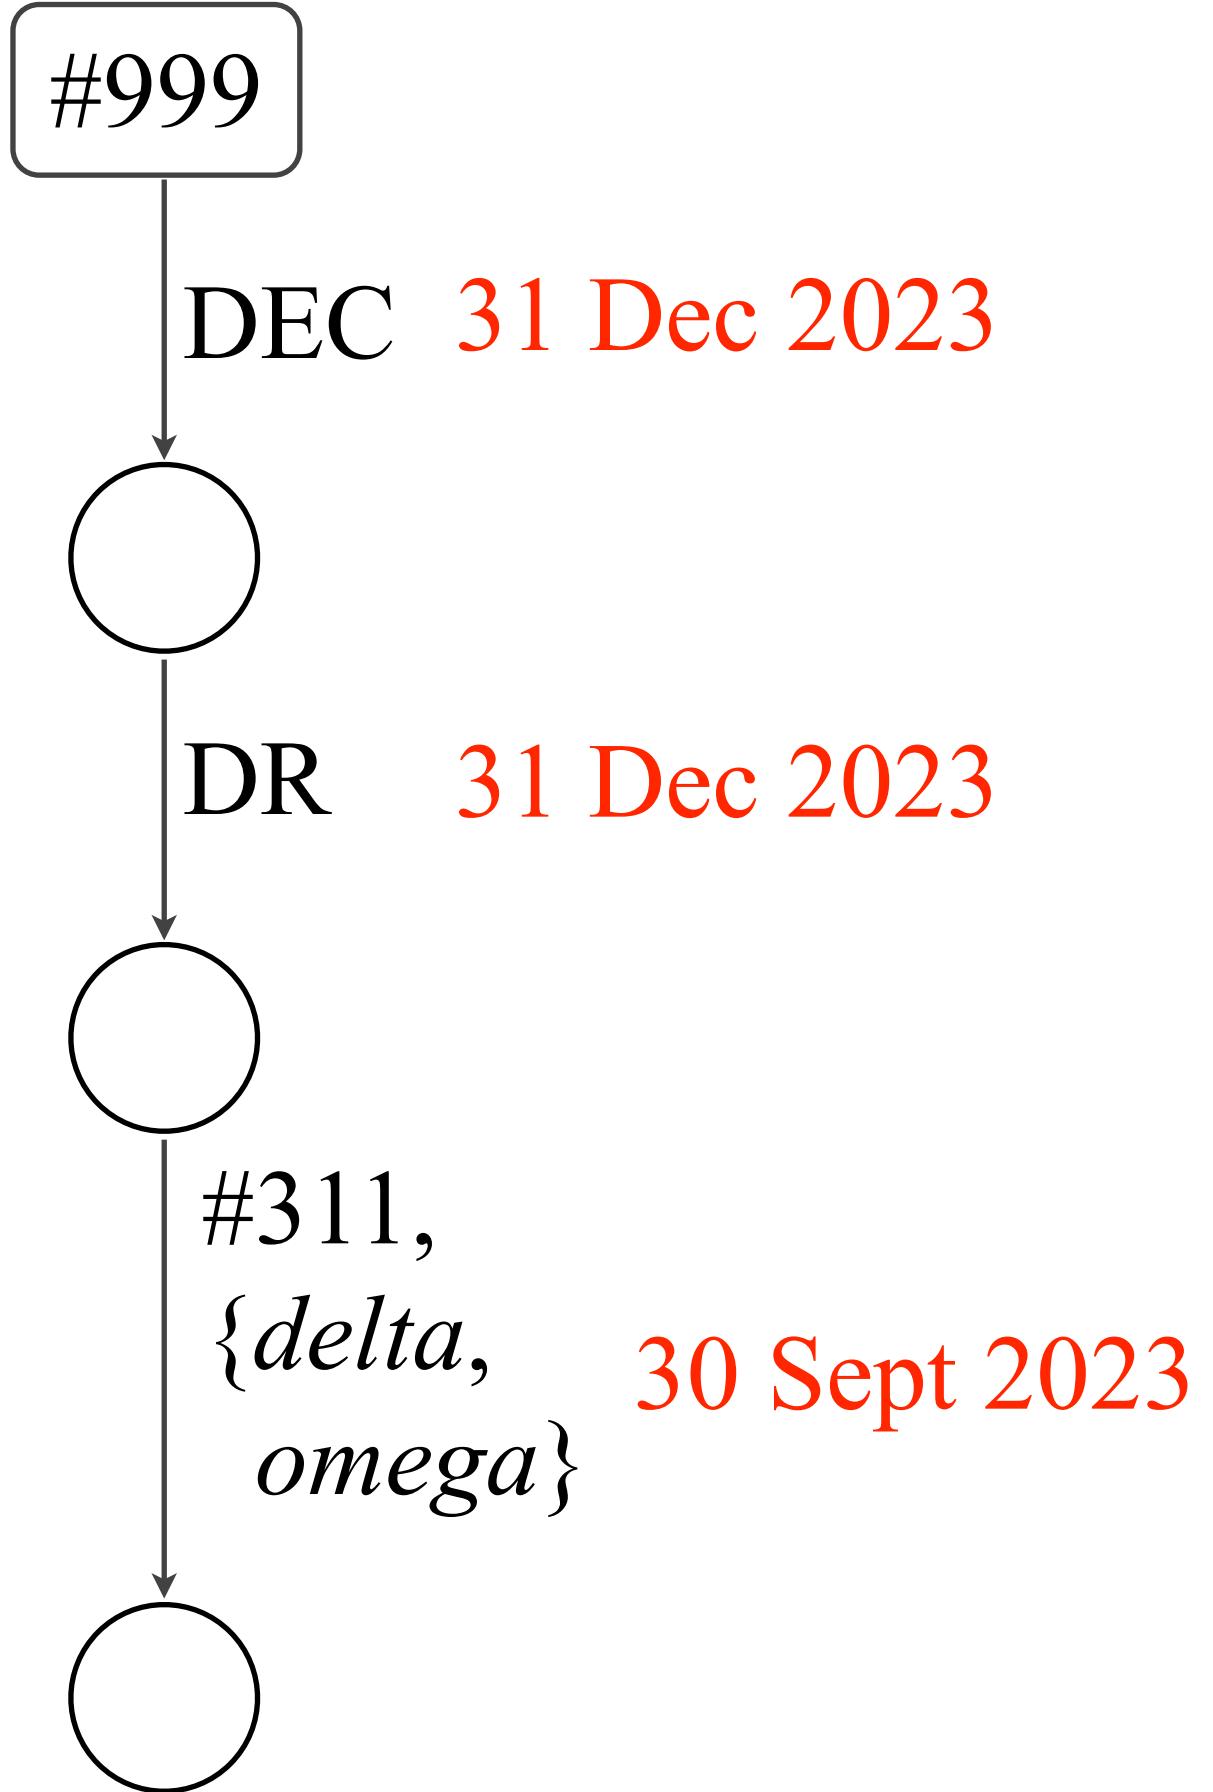

#734/Lampson/Password

Values

#311, *{delta, omega}*

#734, *{alpha, beta}*

vn xm 56

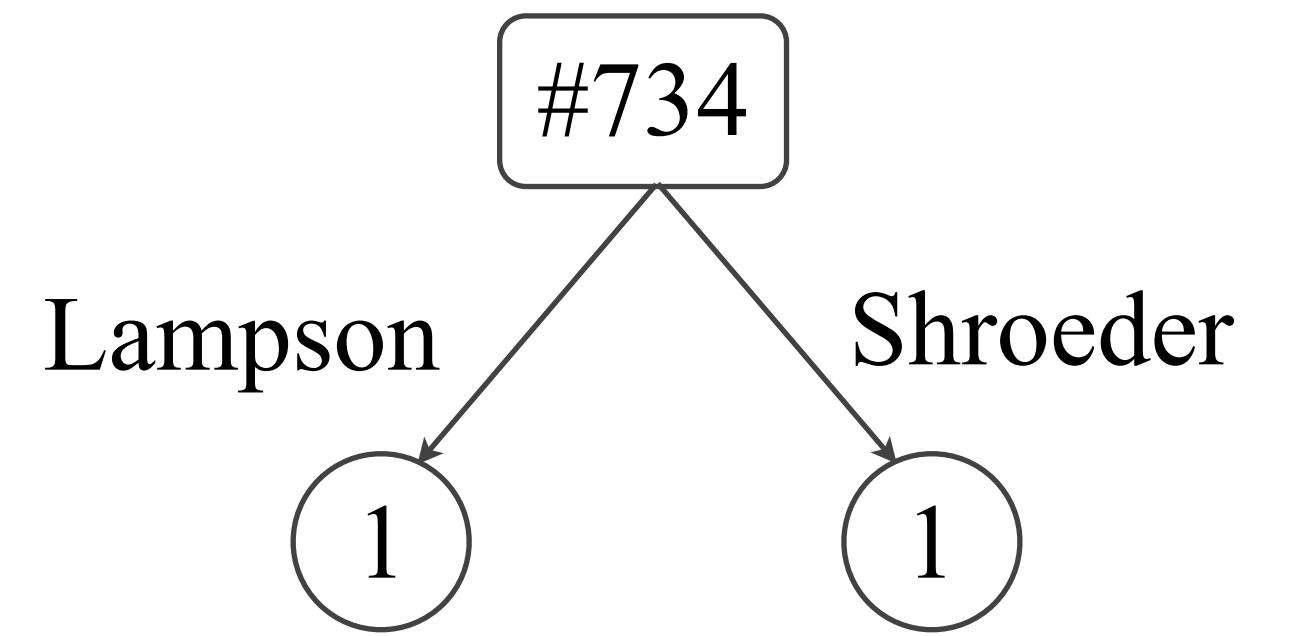

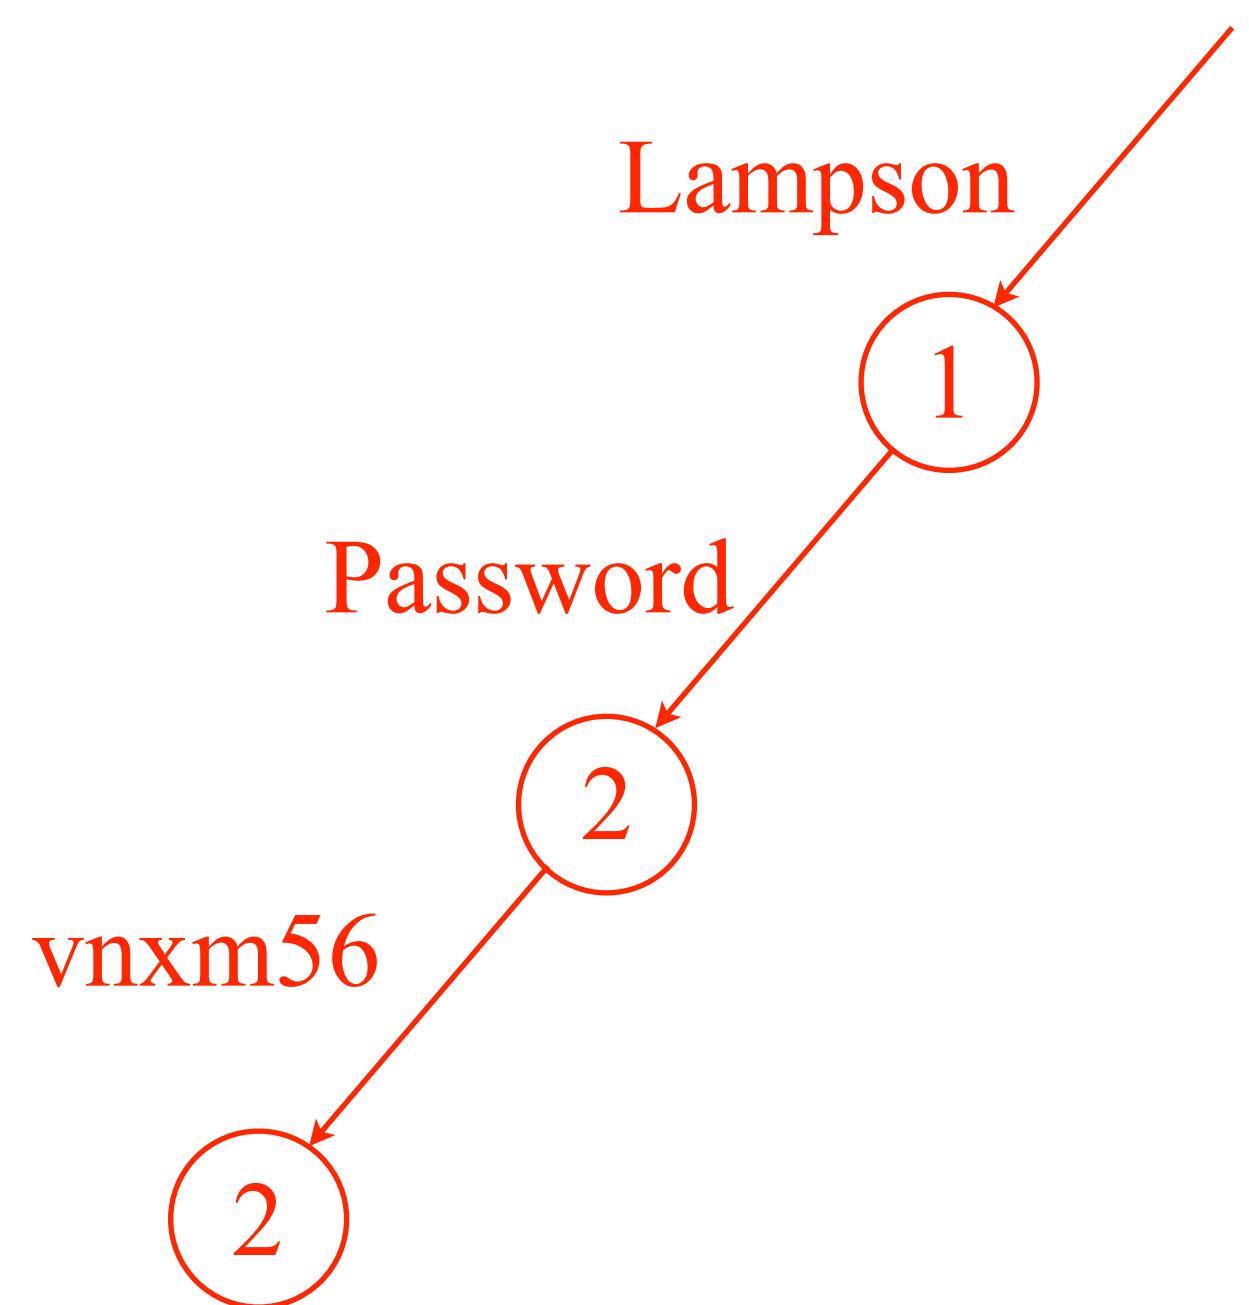

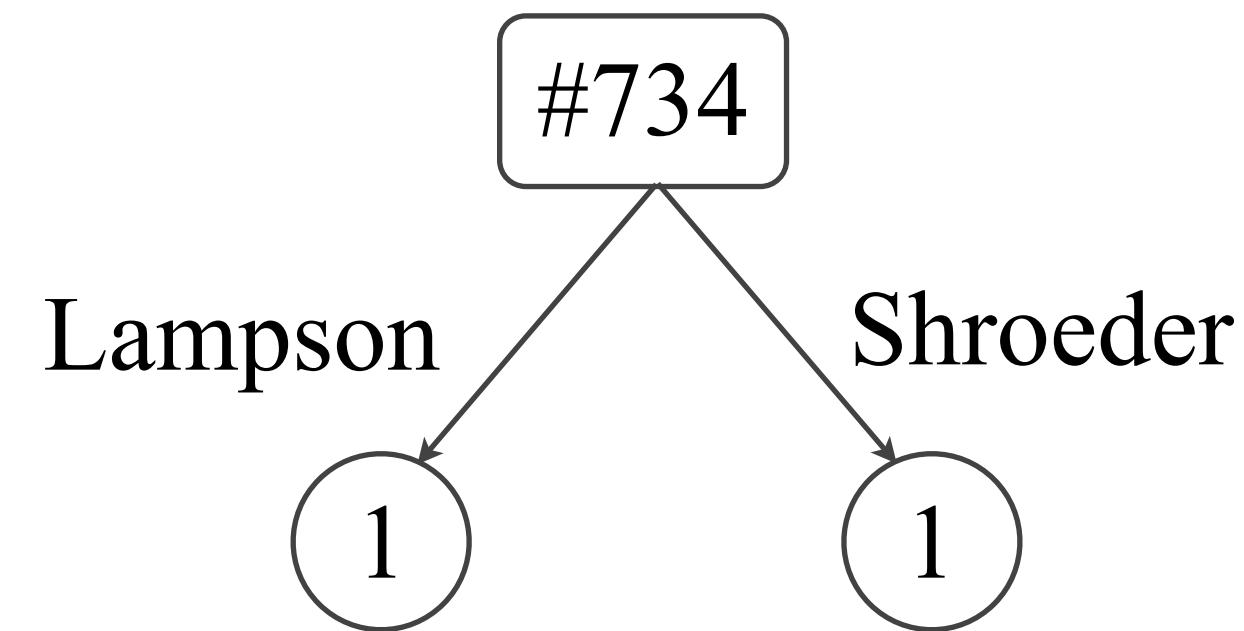

Names	Values
#999/DEC/SRC/Lampson/Password	
#999/DEC/DR	
	#311, <i>{delta, omega}</i>

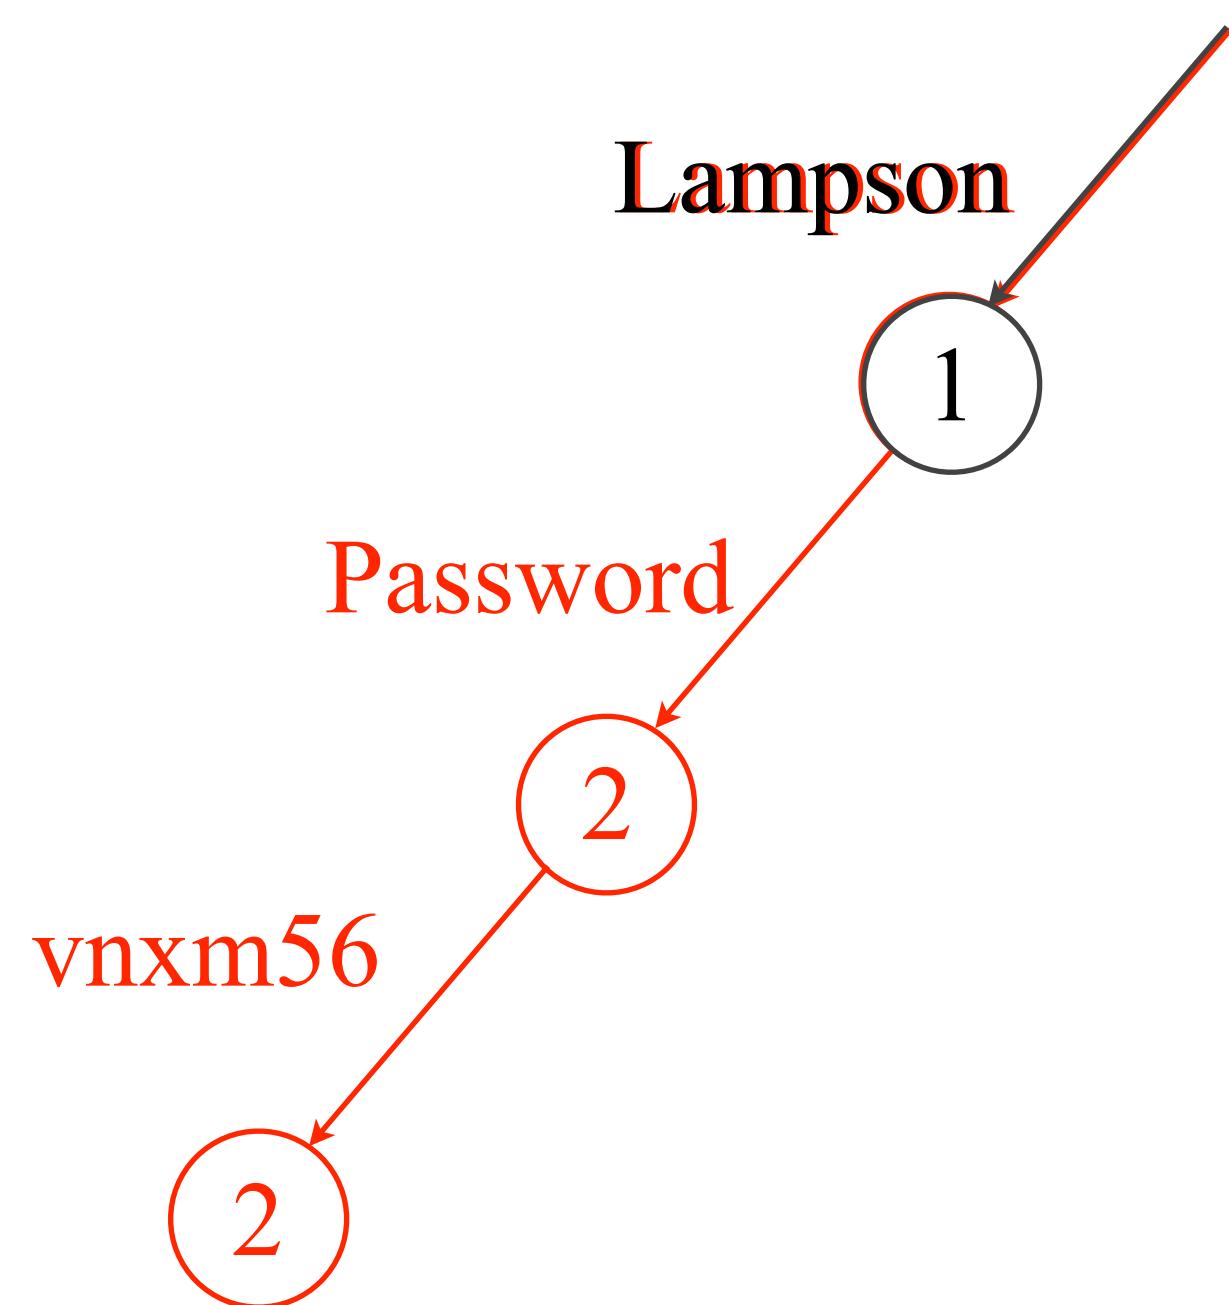

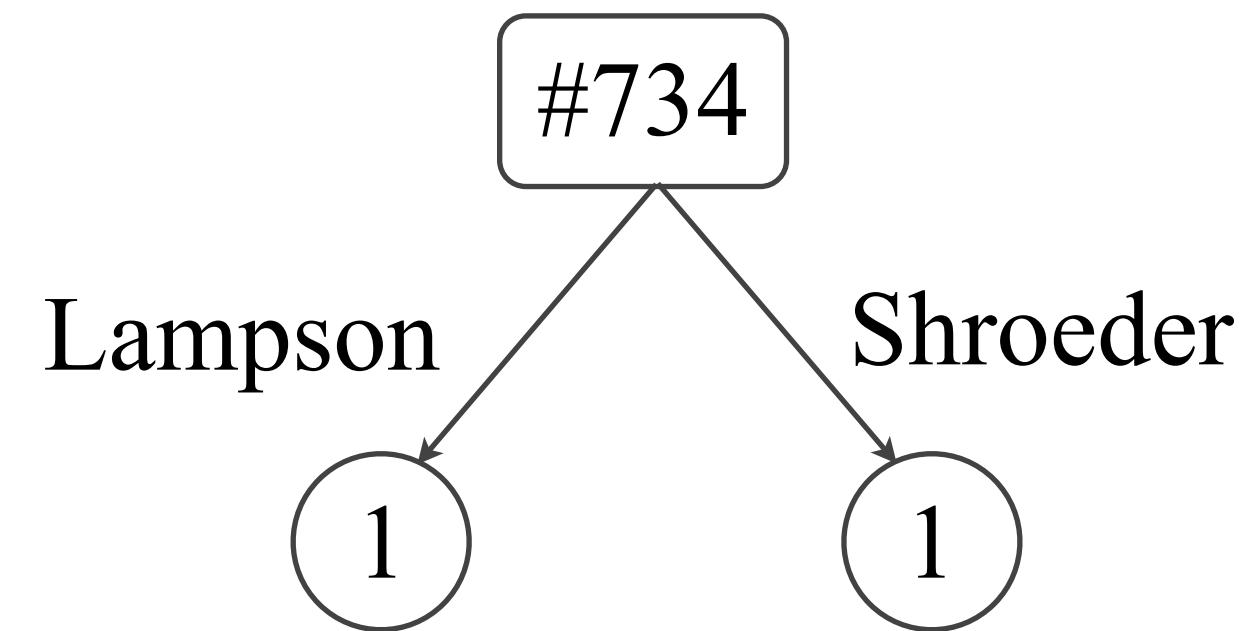

Name lookup

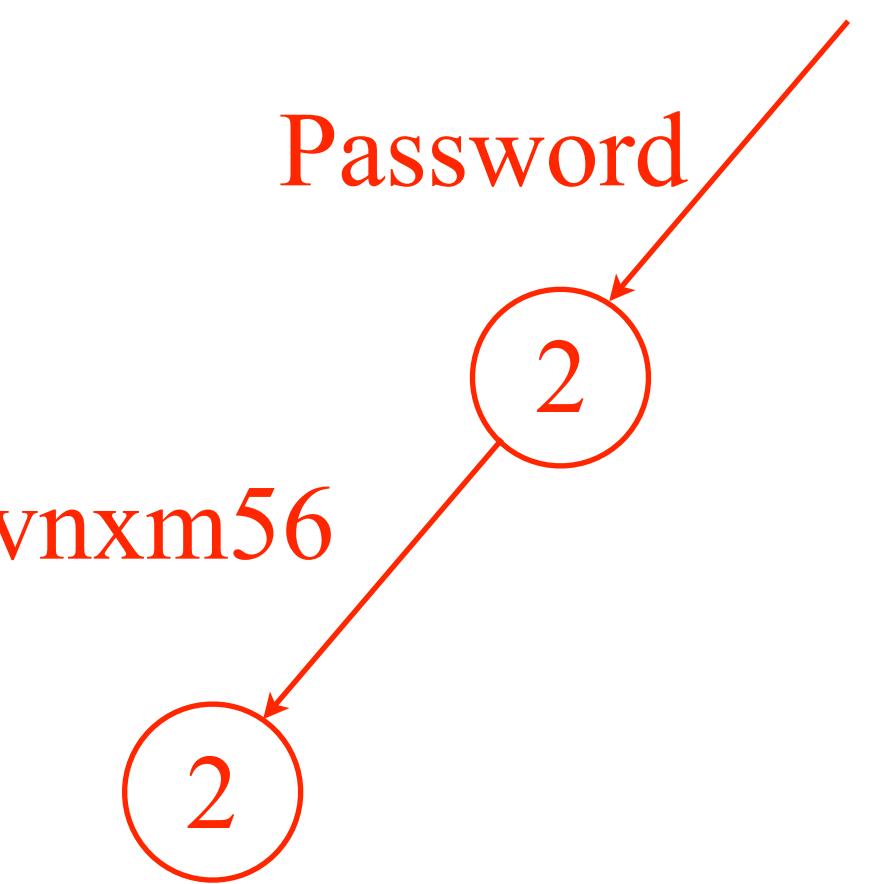

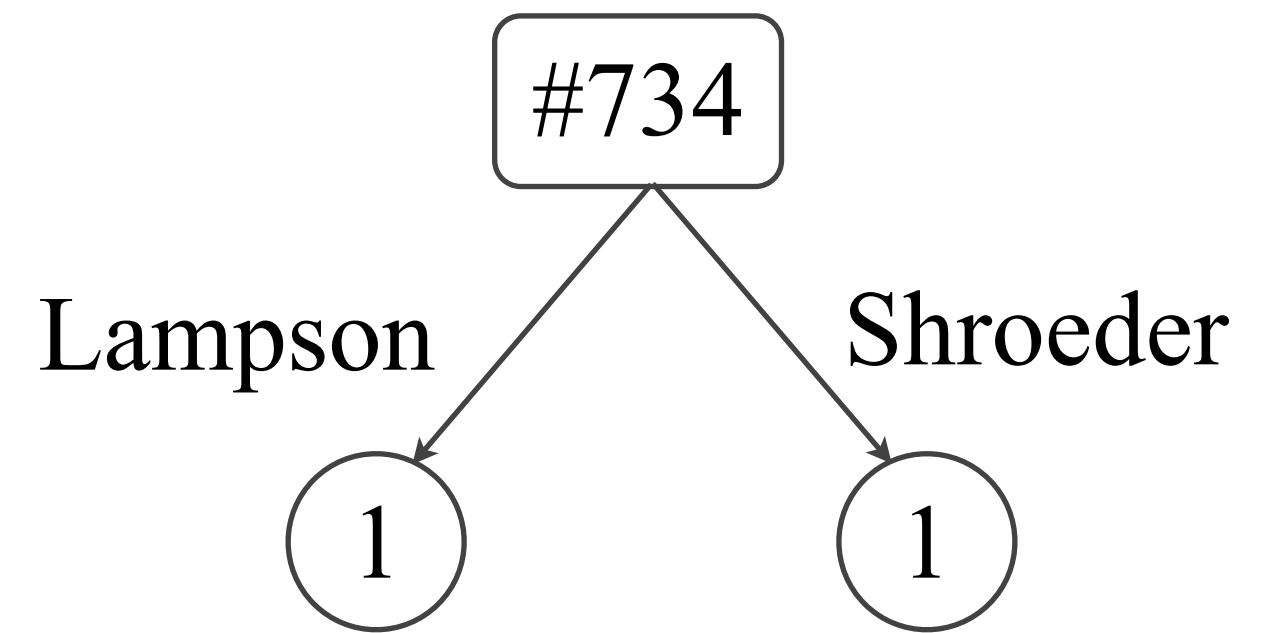

- Clients can **cache** mappings to reduce latency
- Stale mappings avoided through **expiration times**

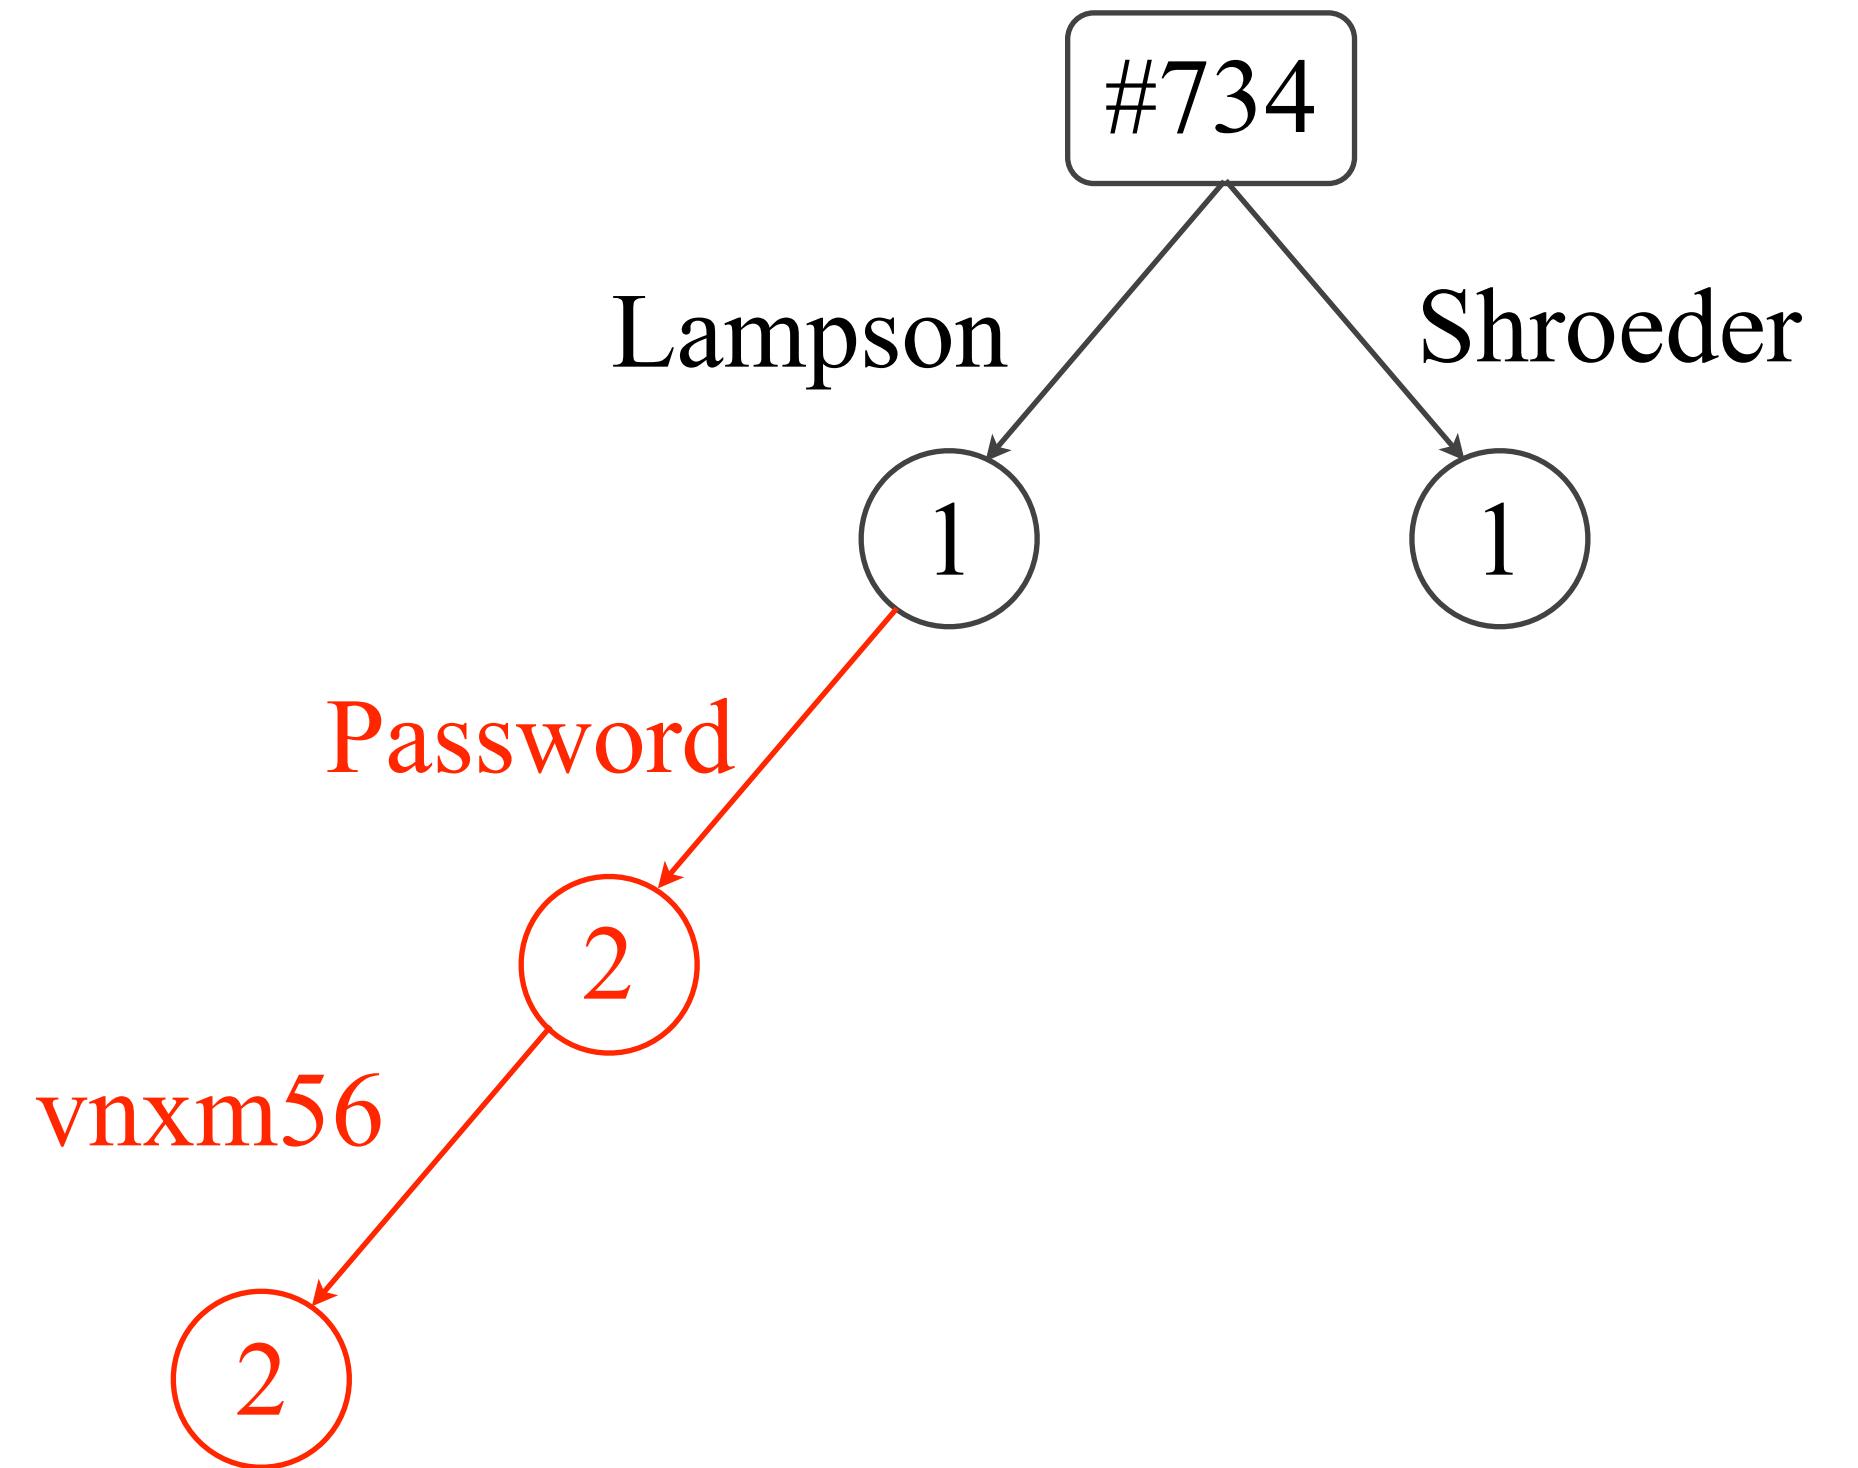

Updates

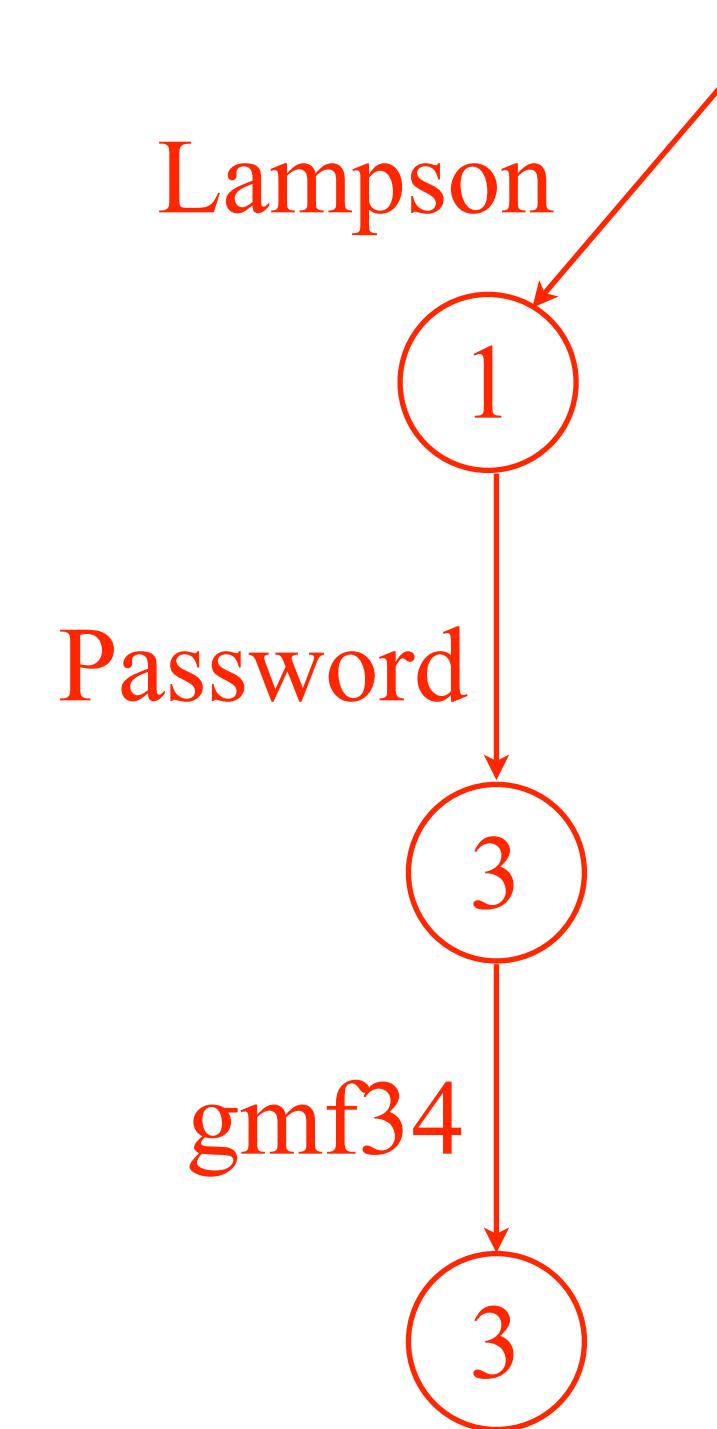

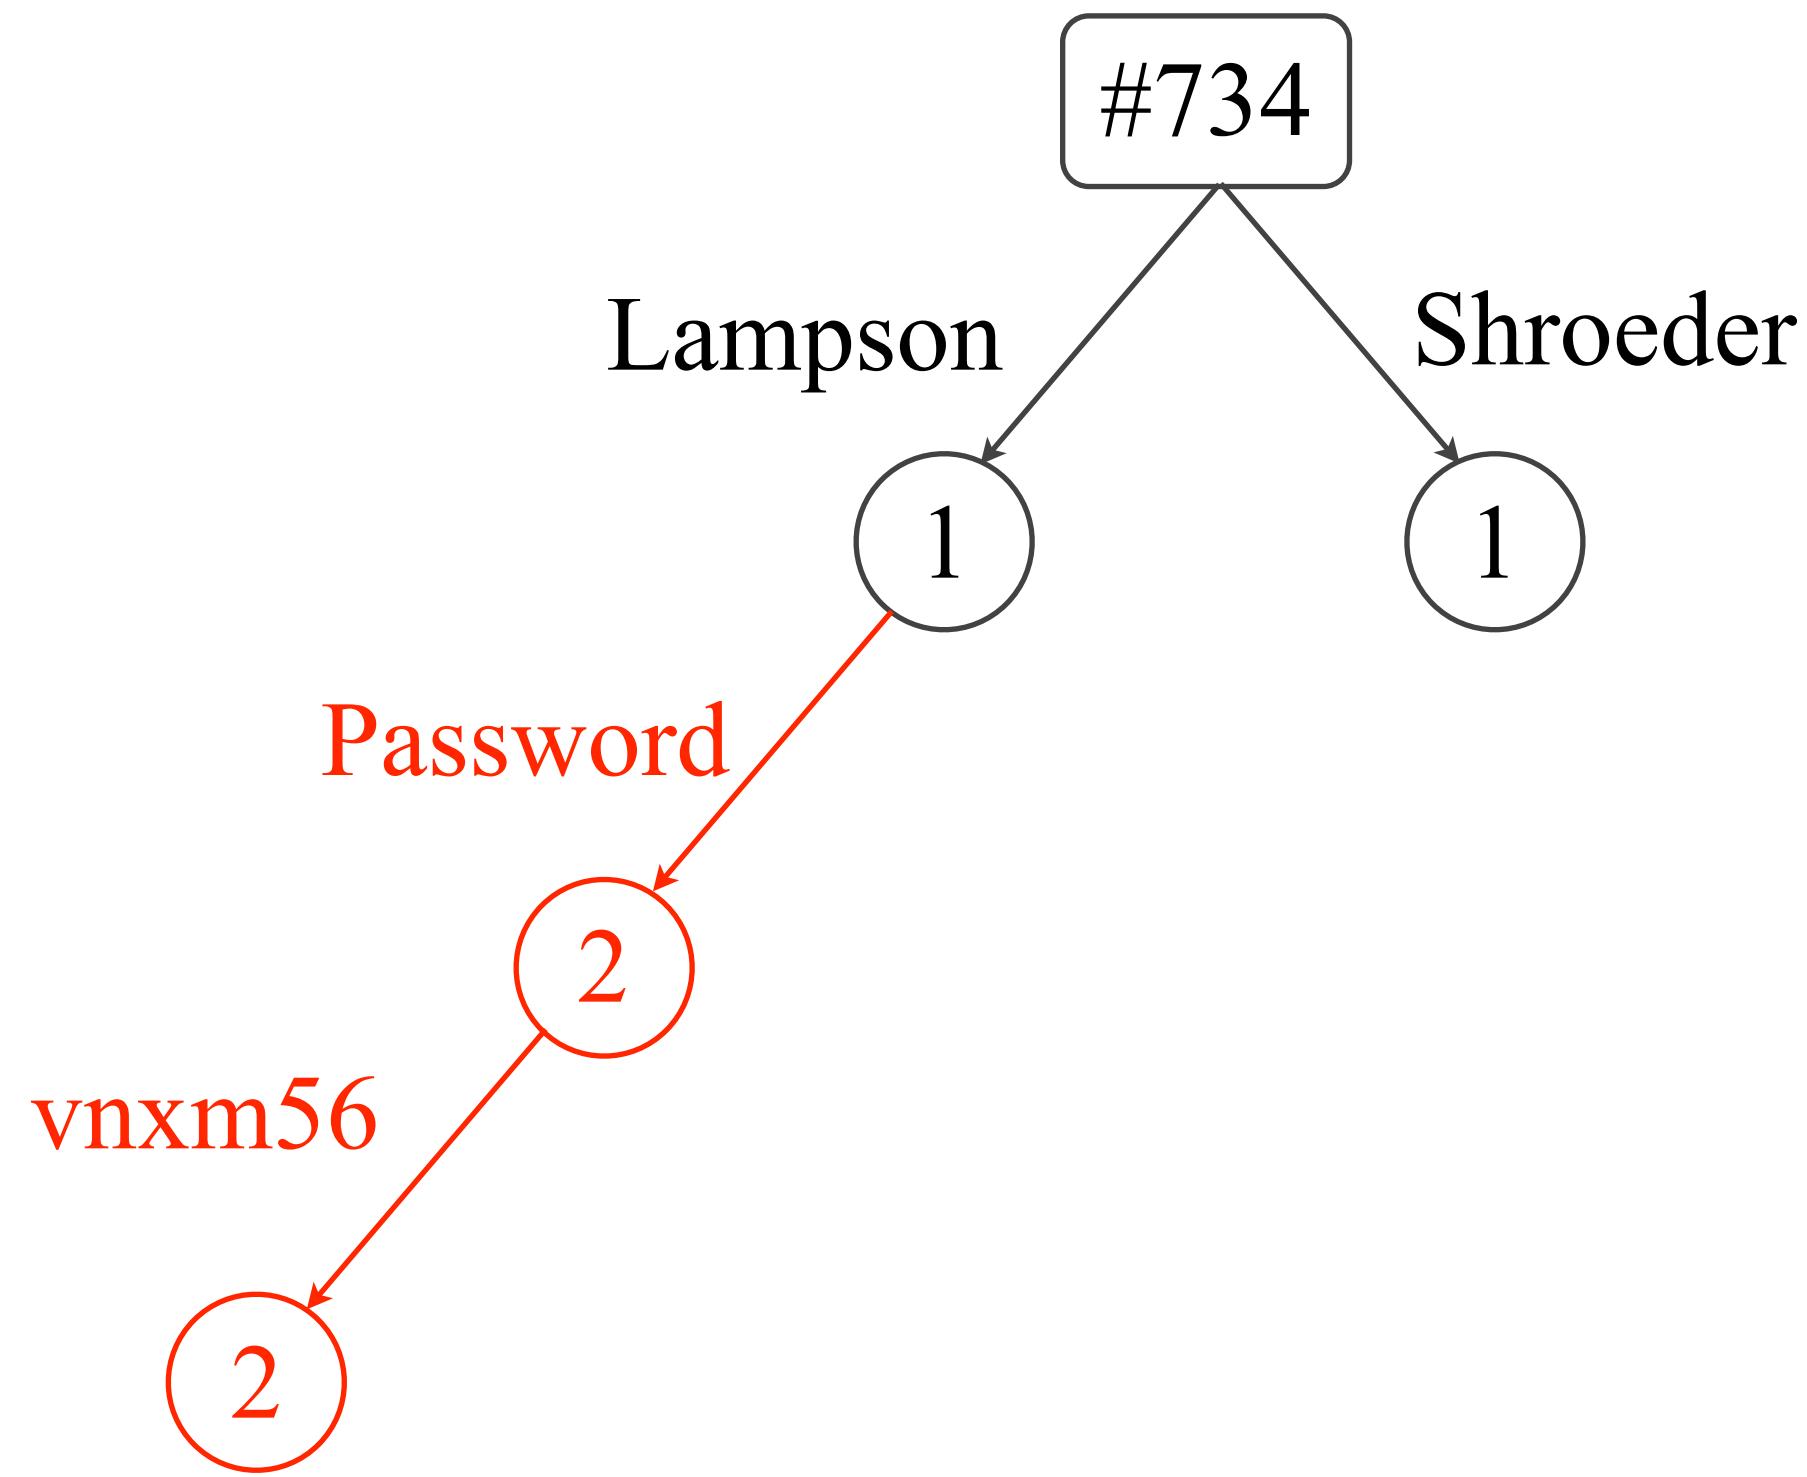

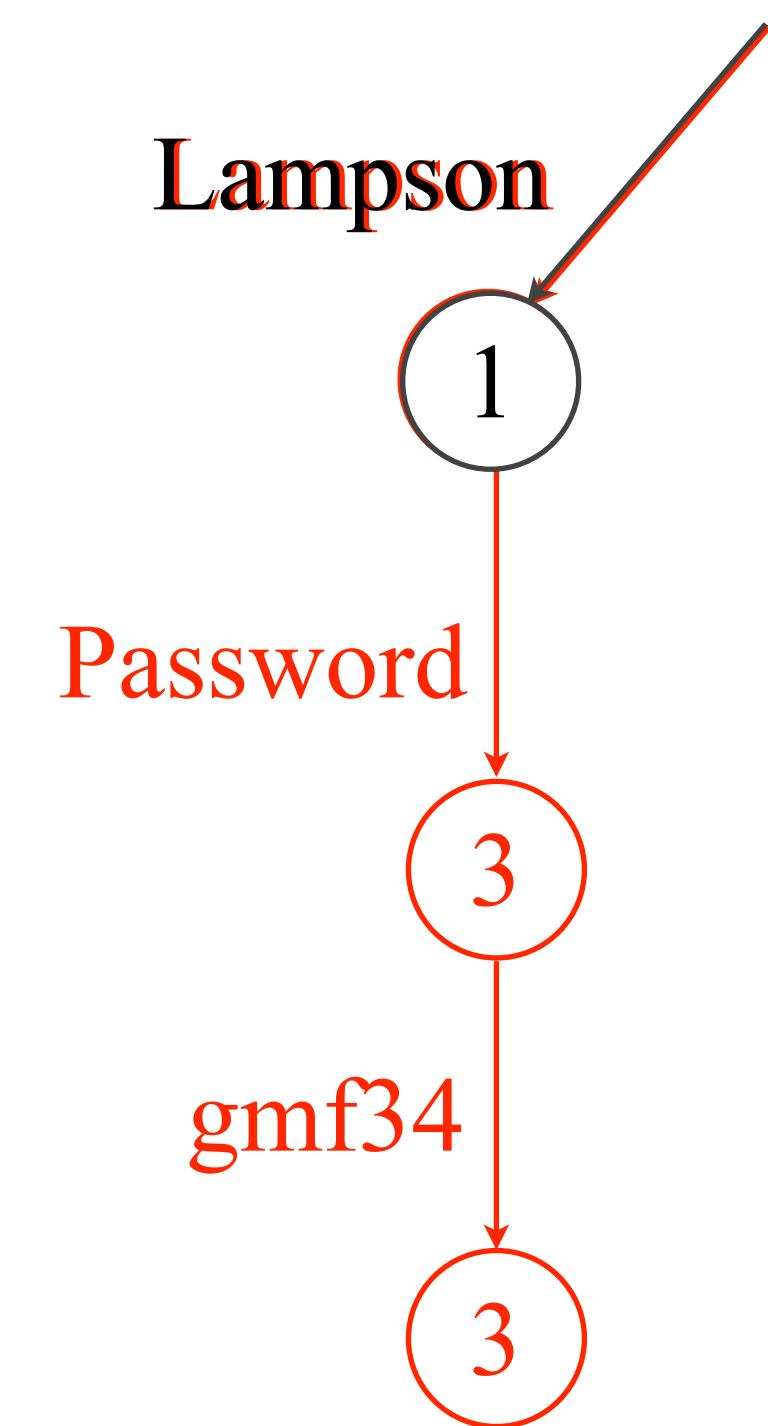

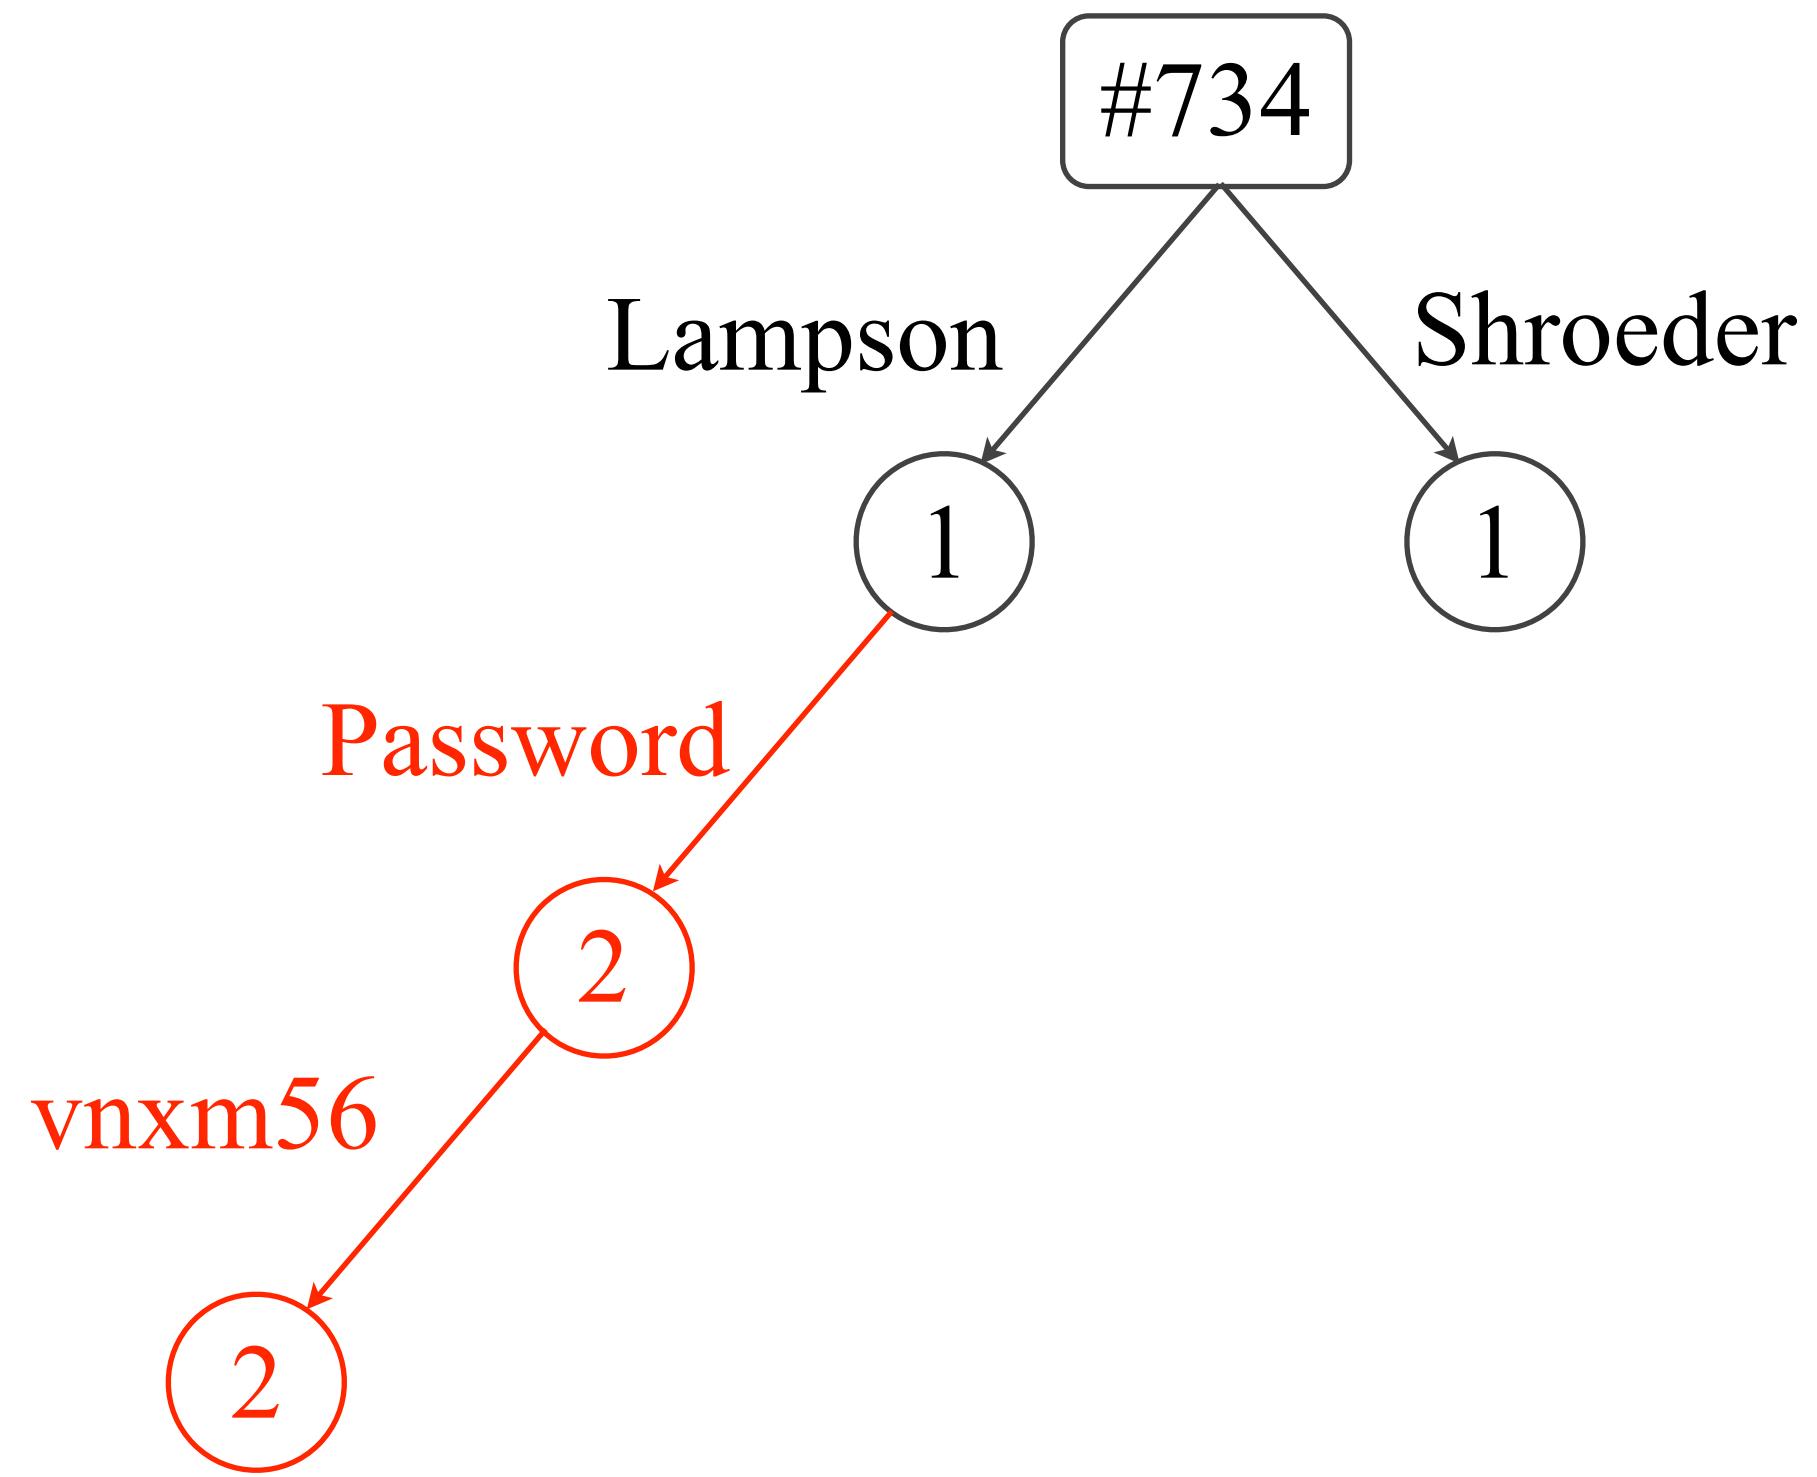

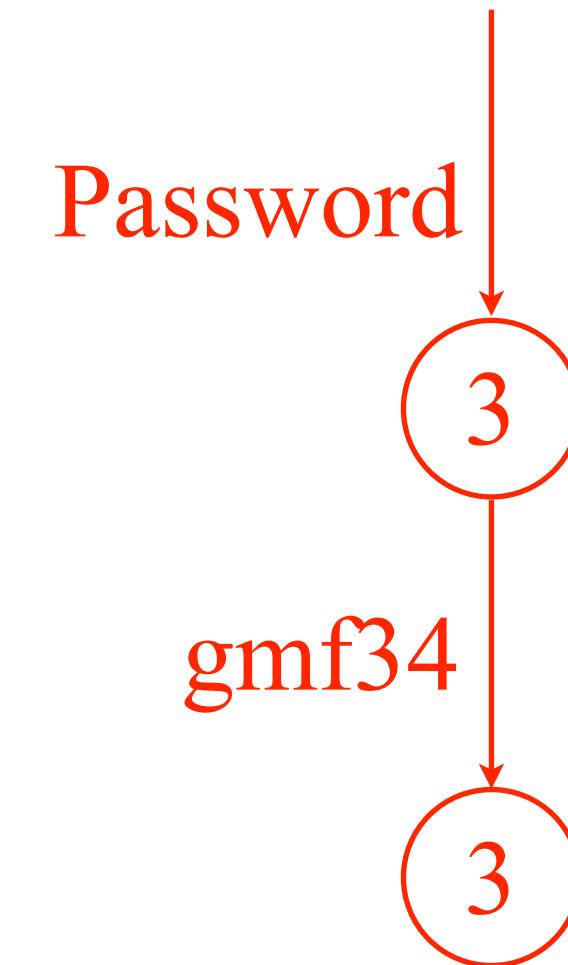

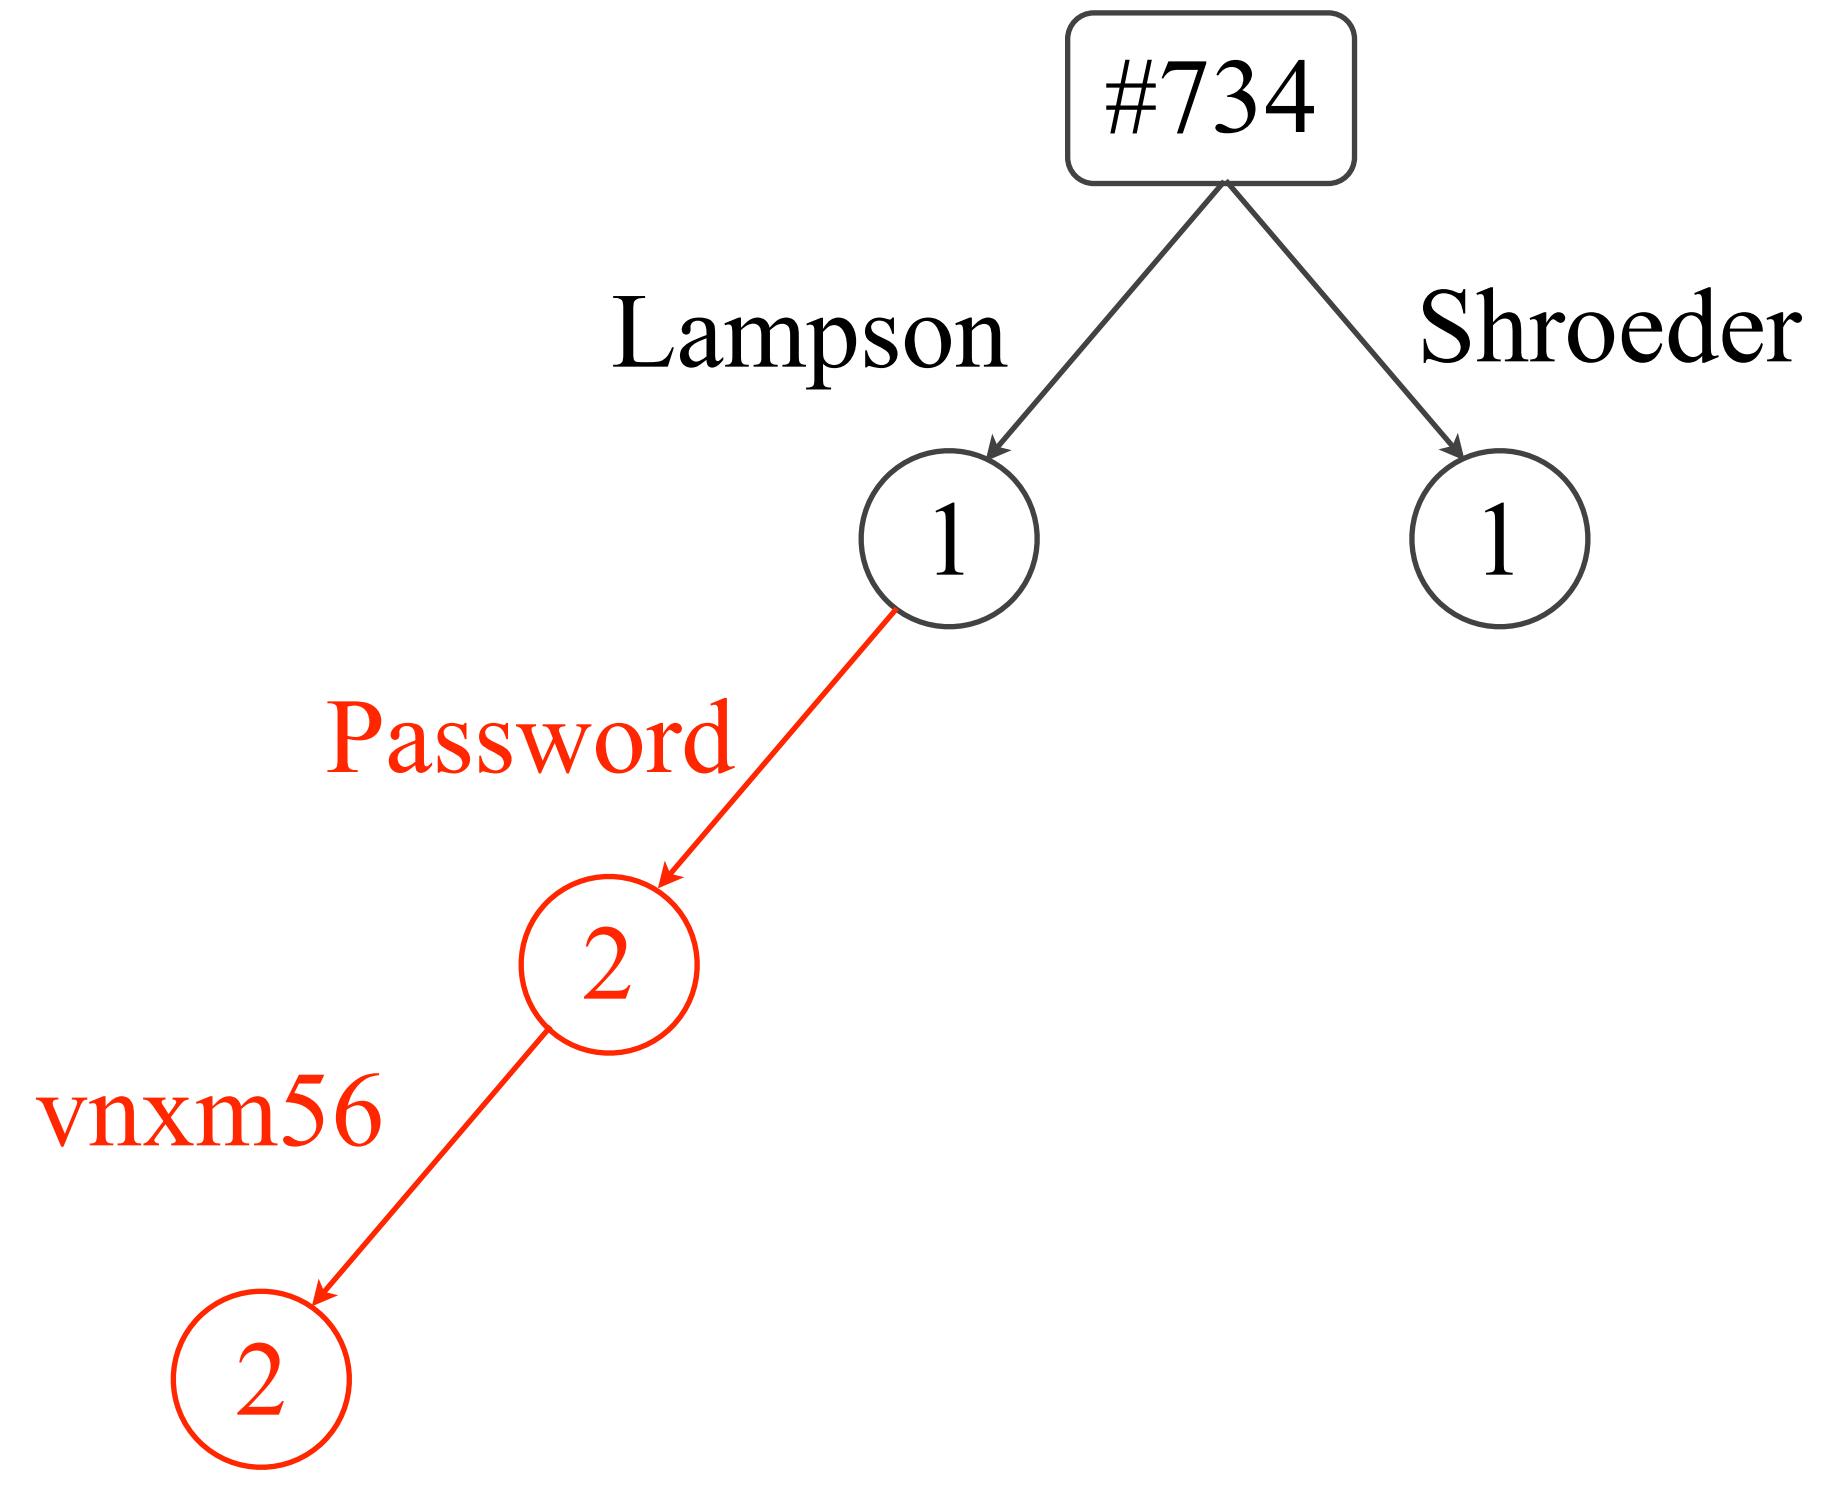

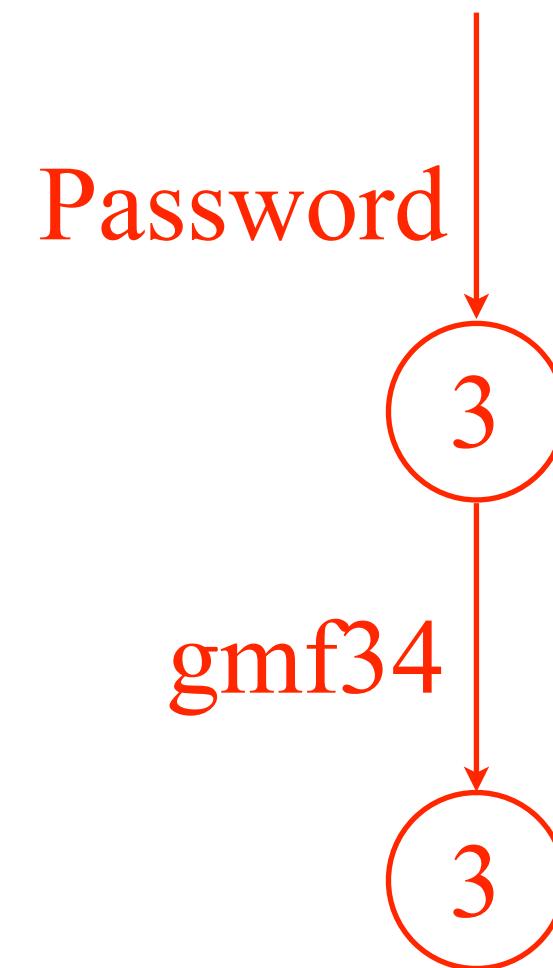

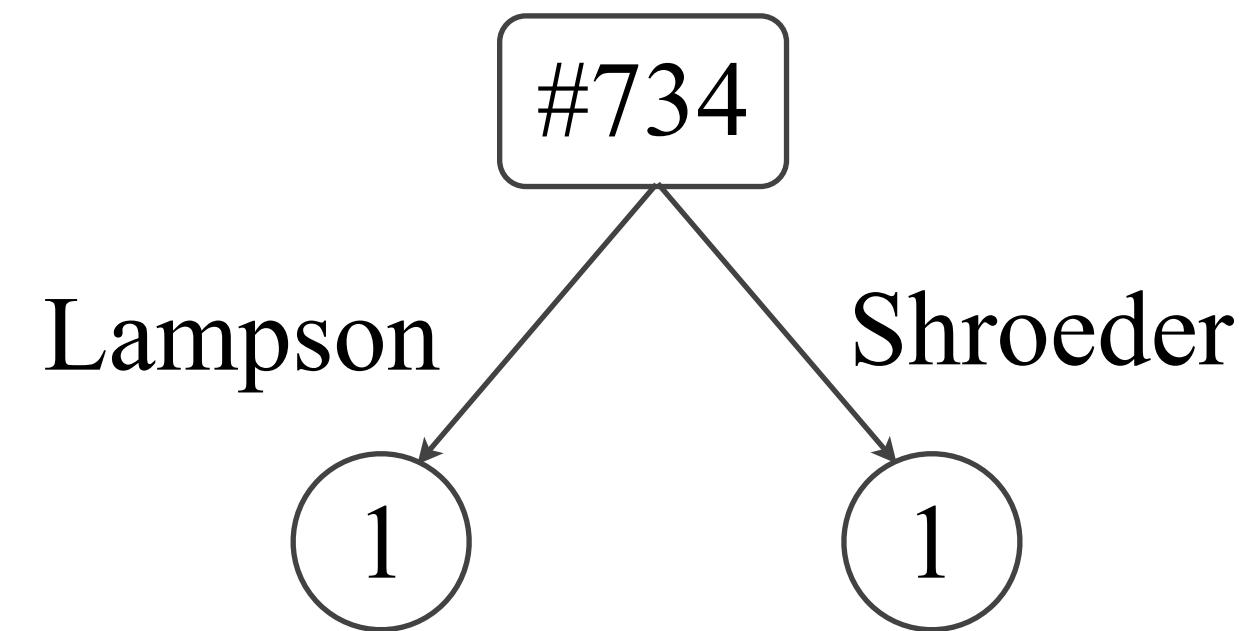

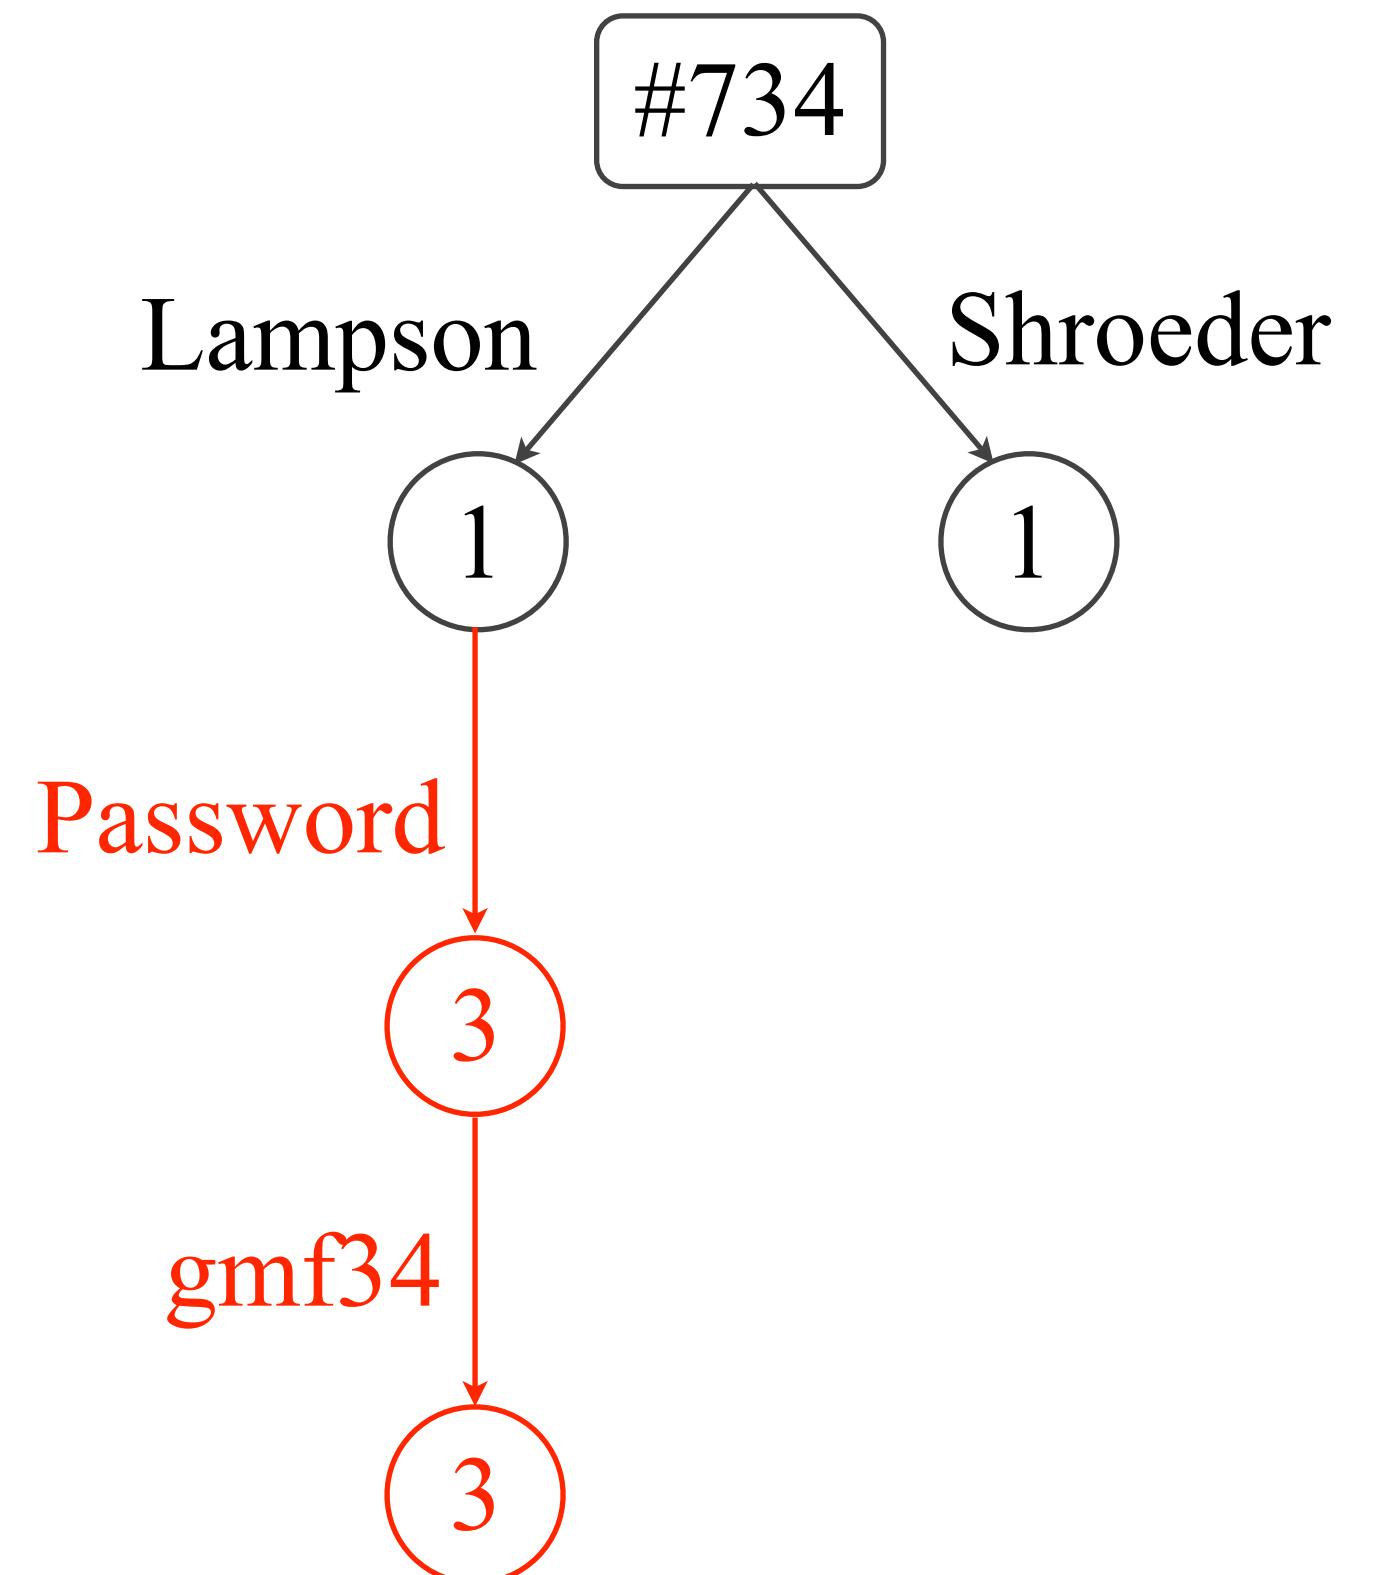

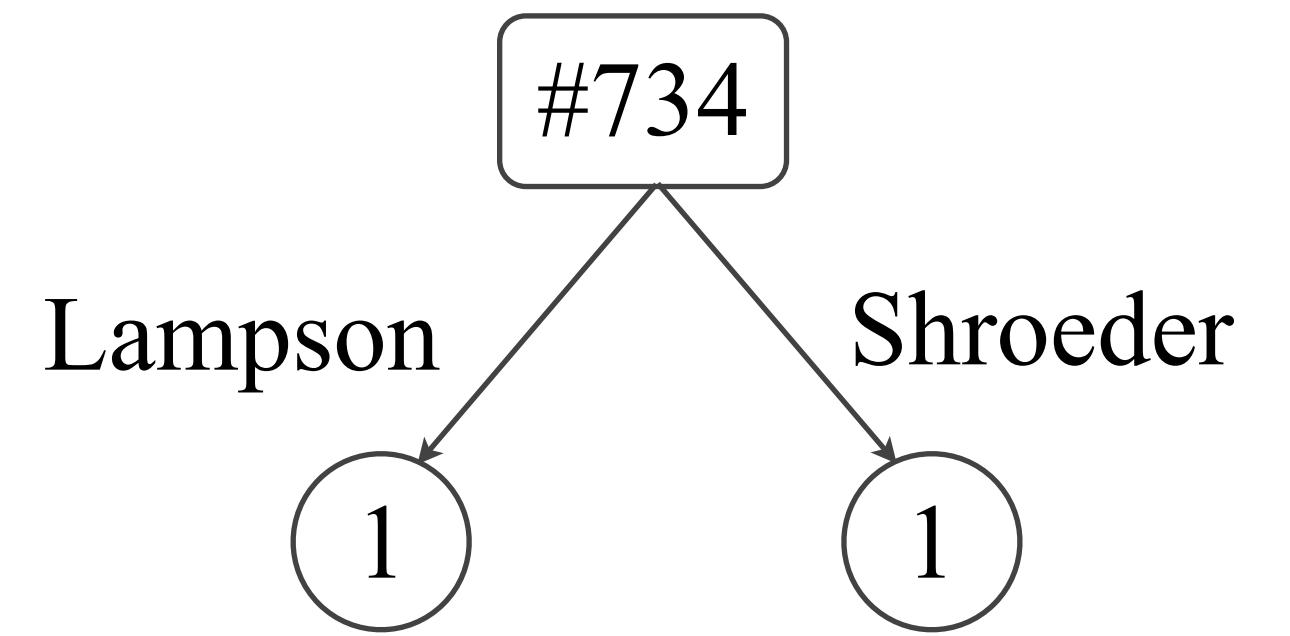

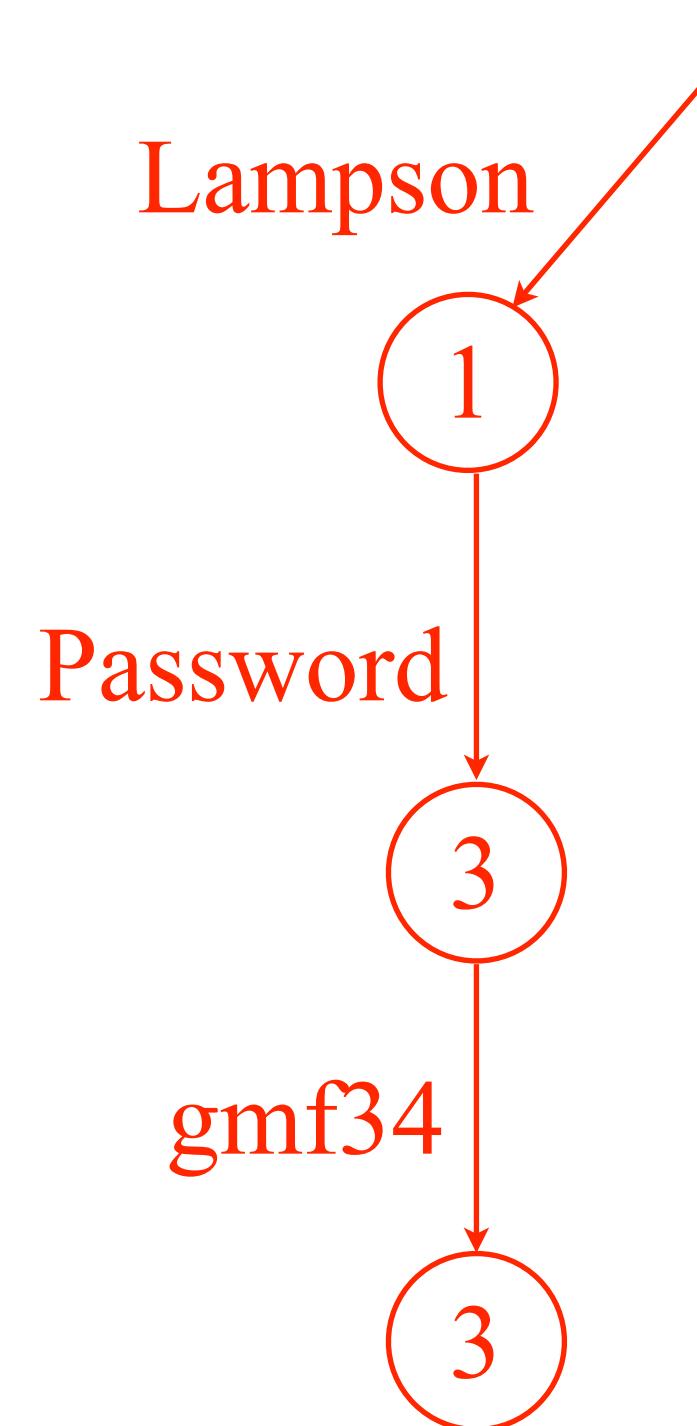

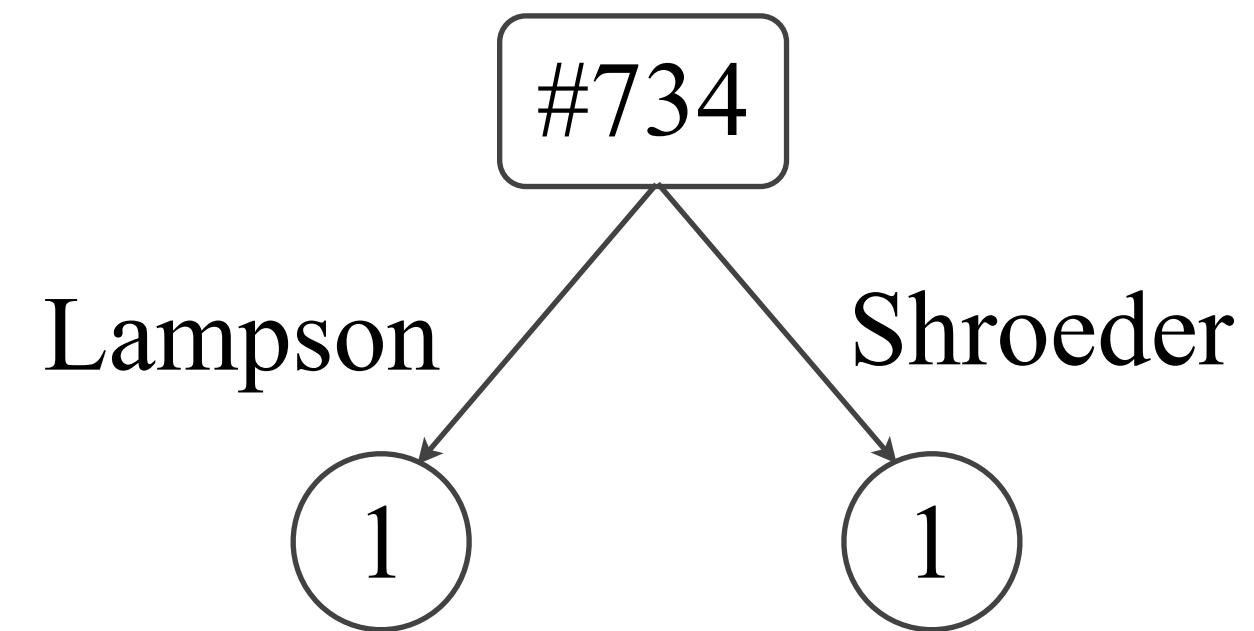

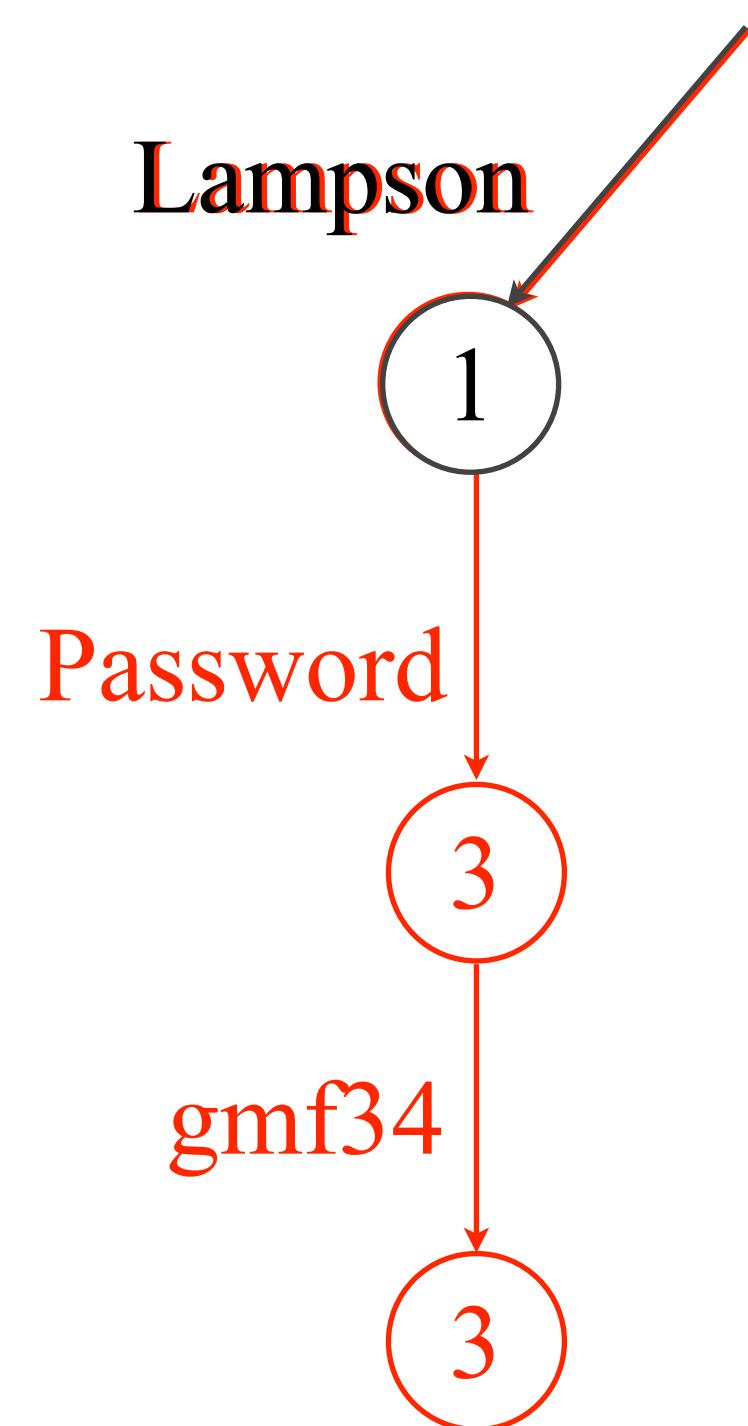

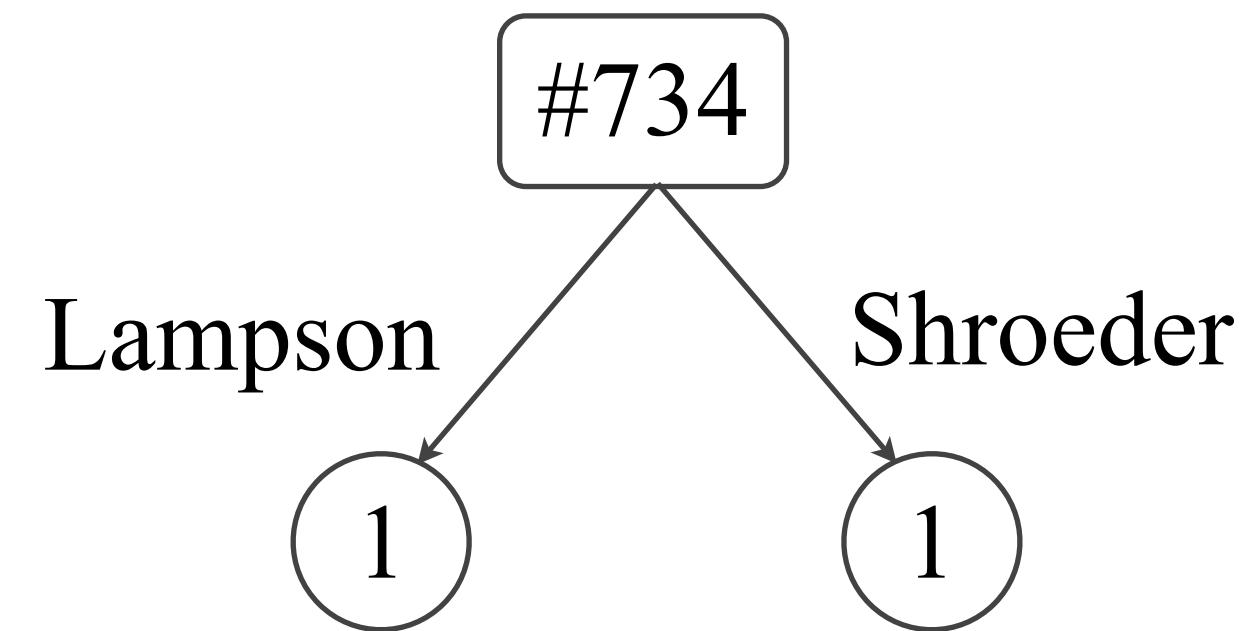

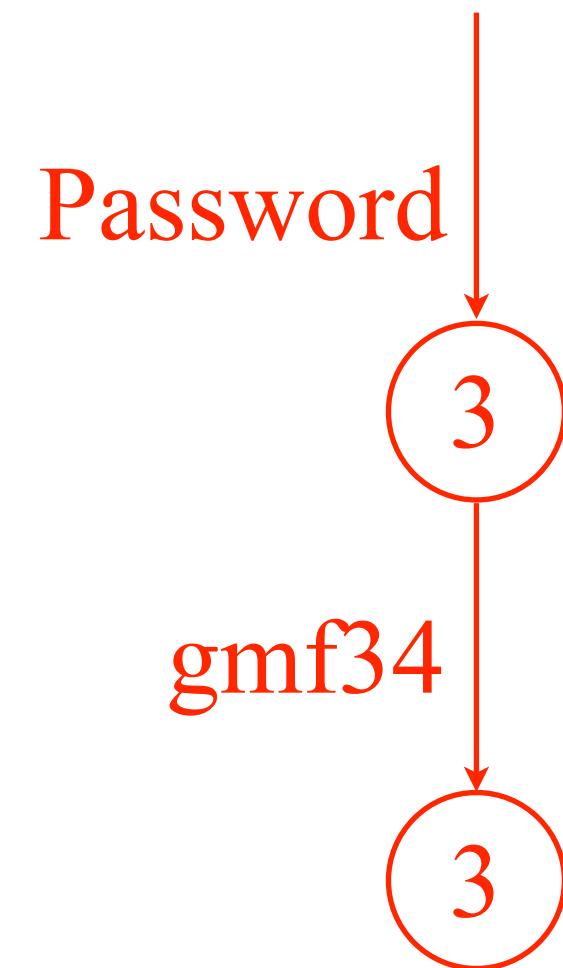

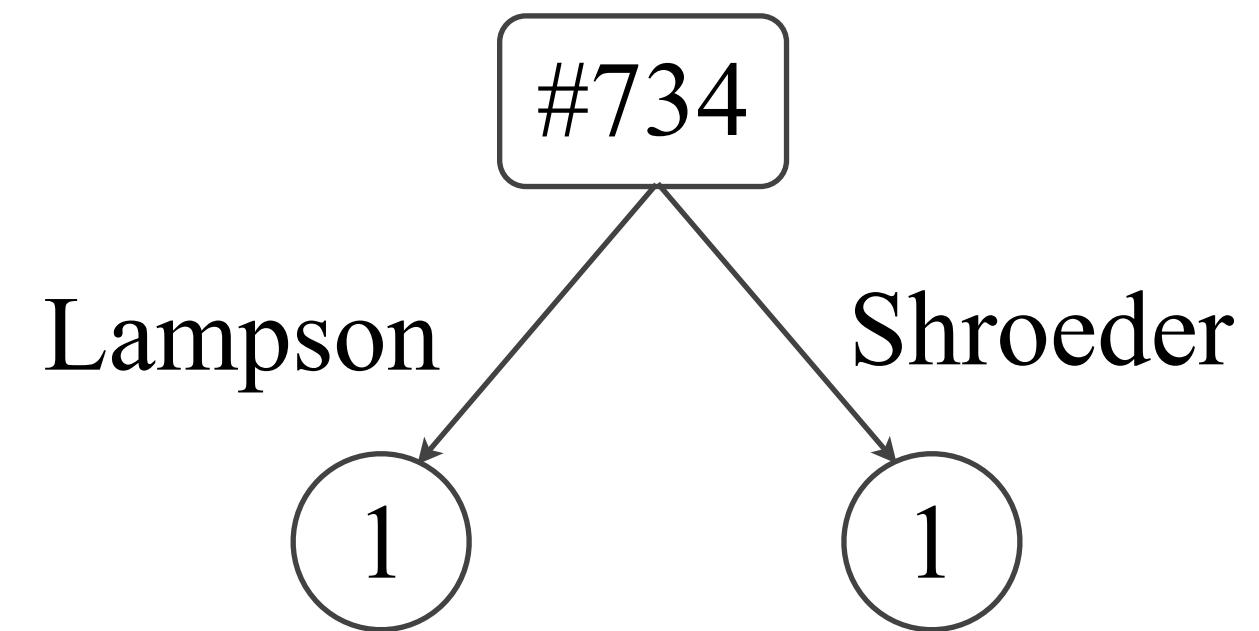

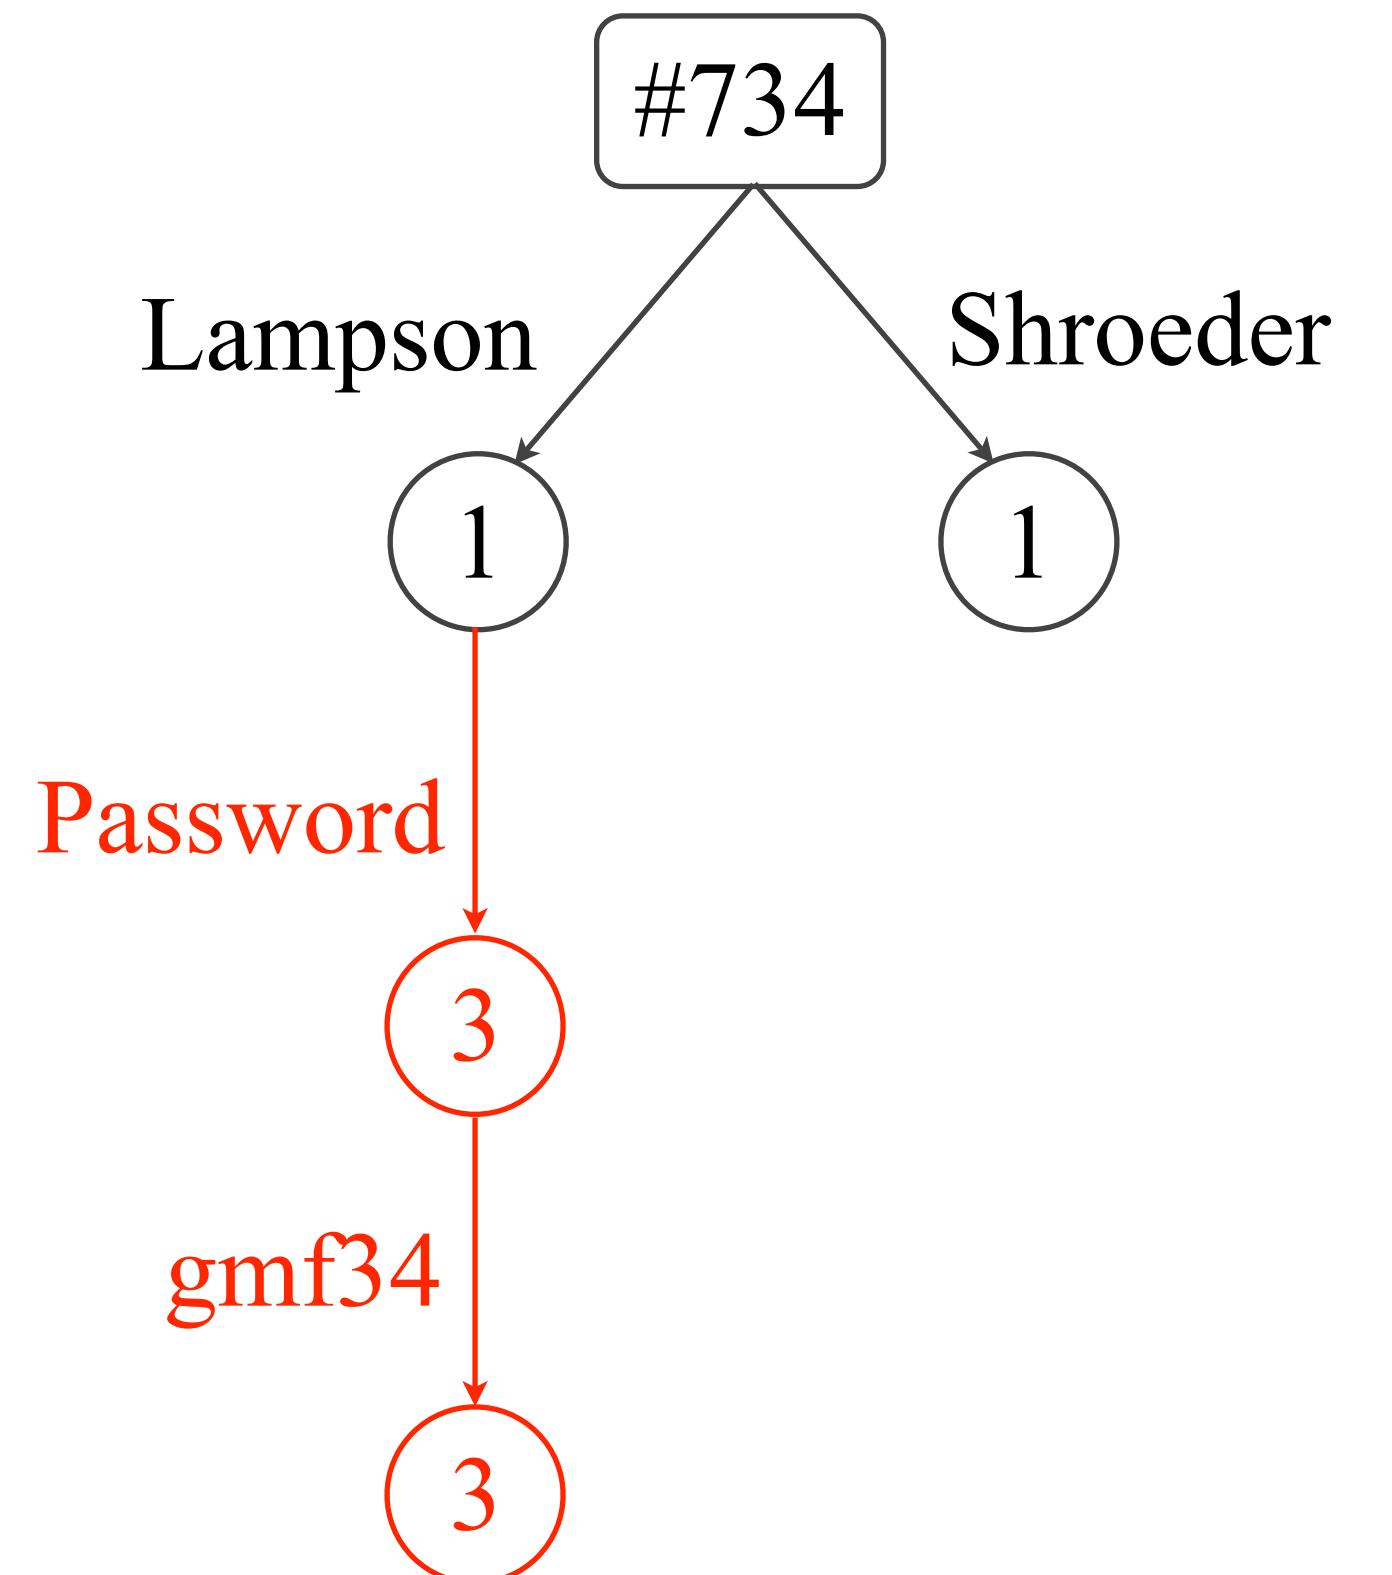

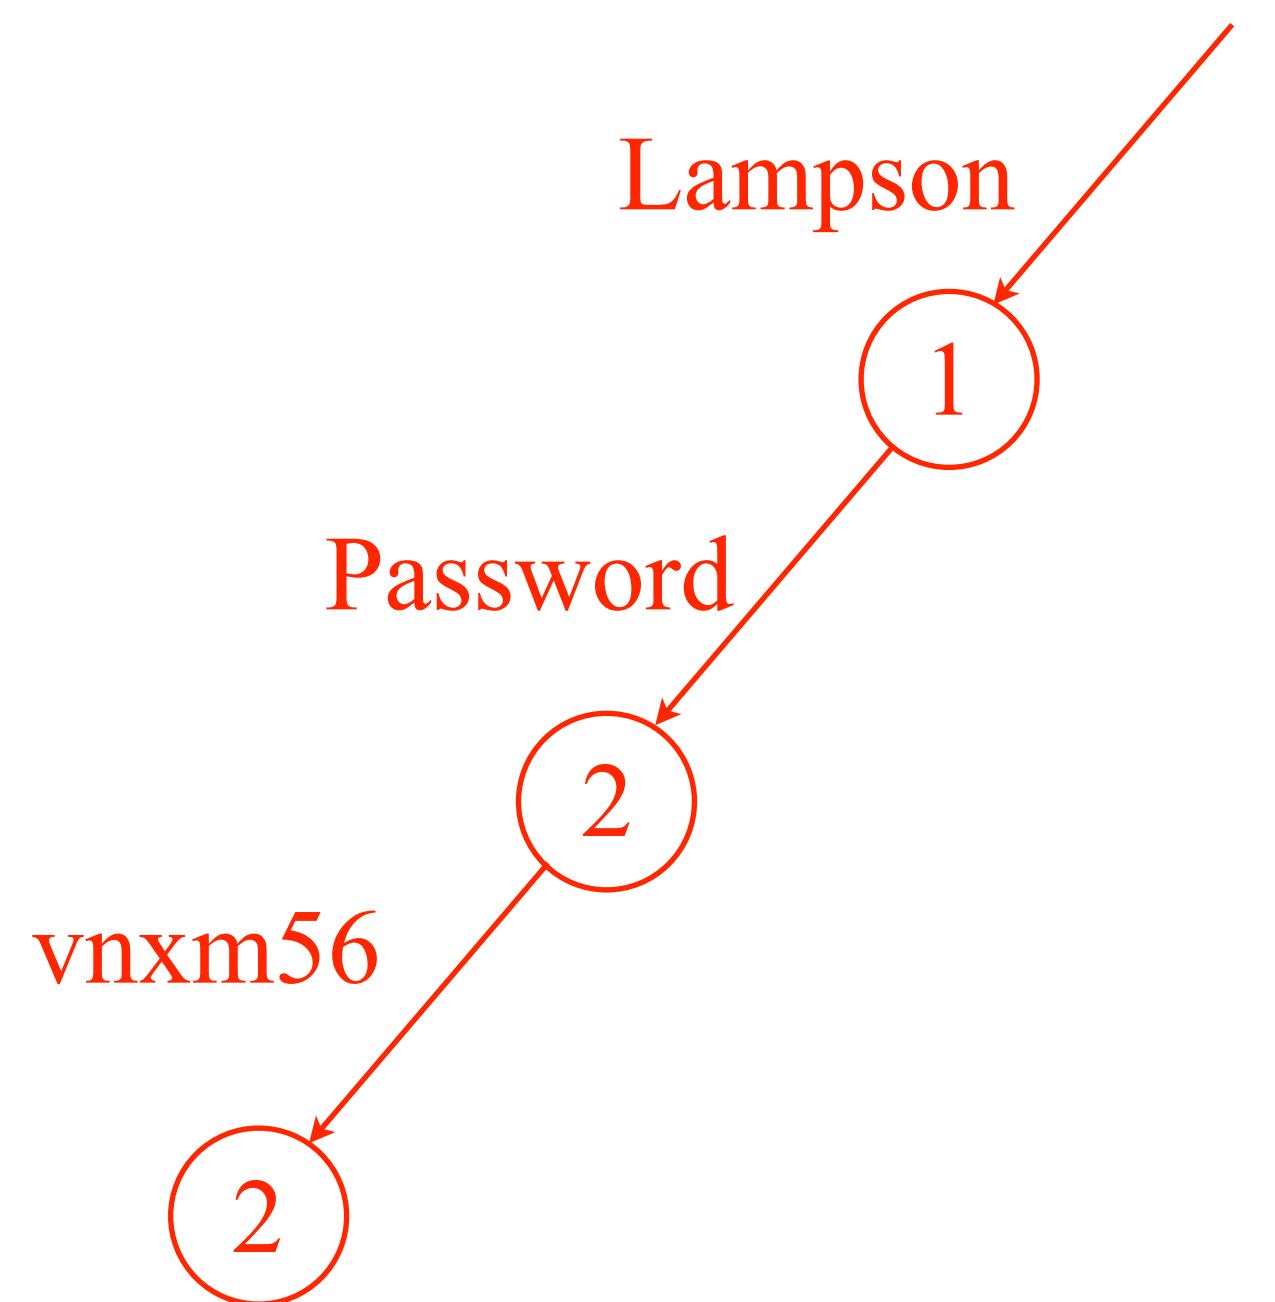

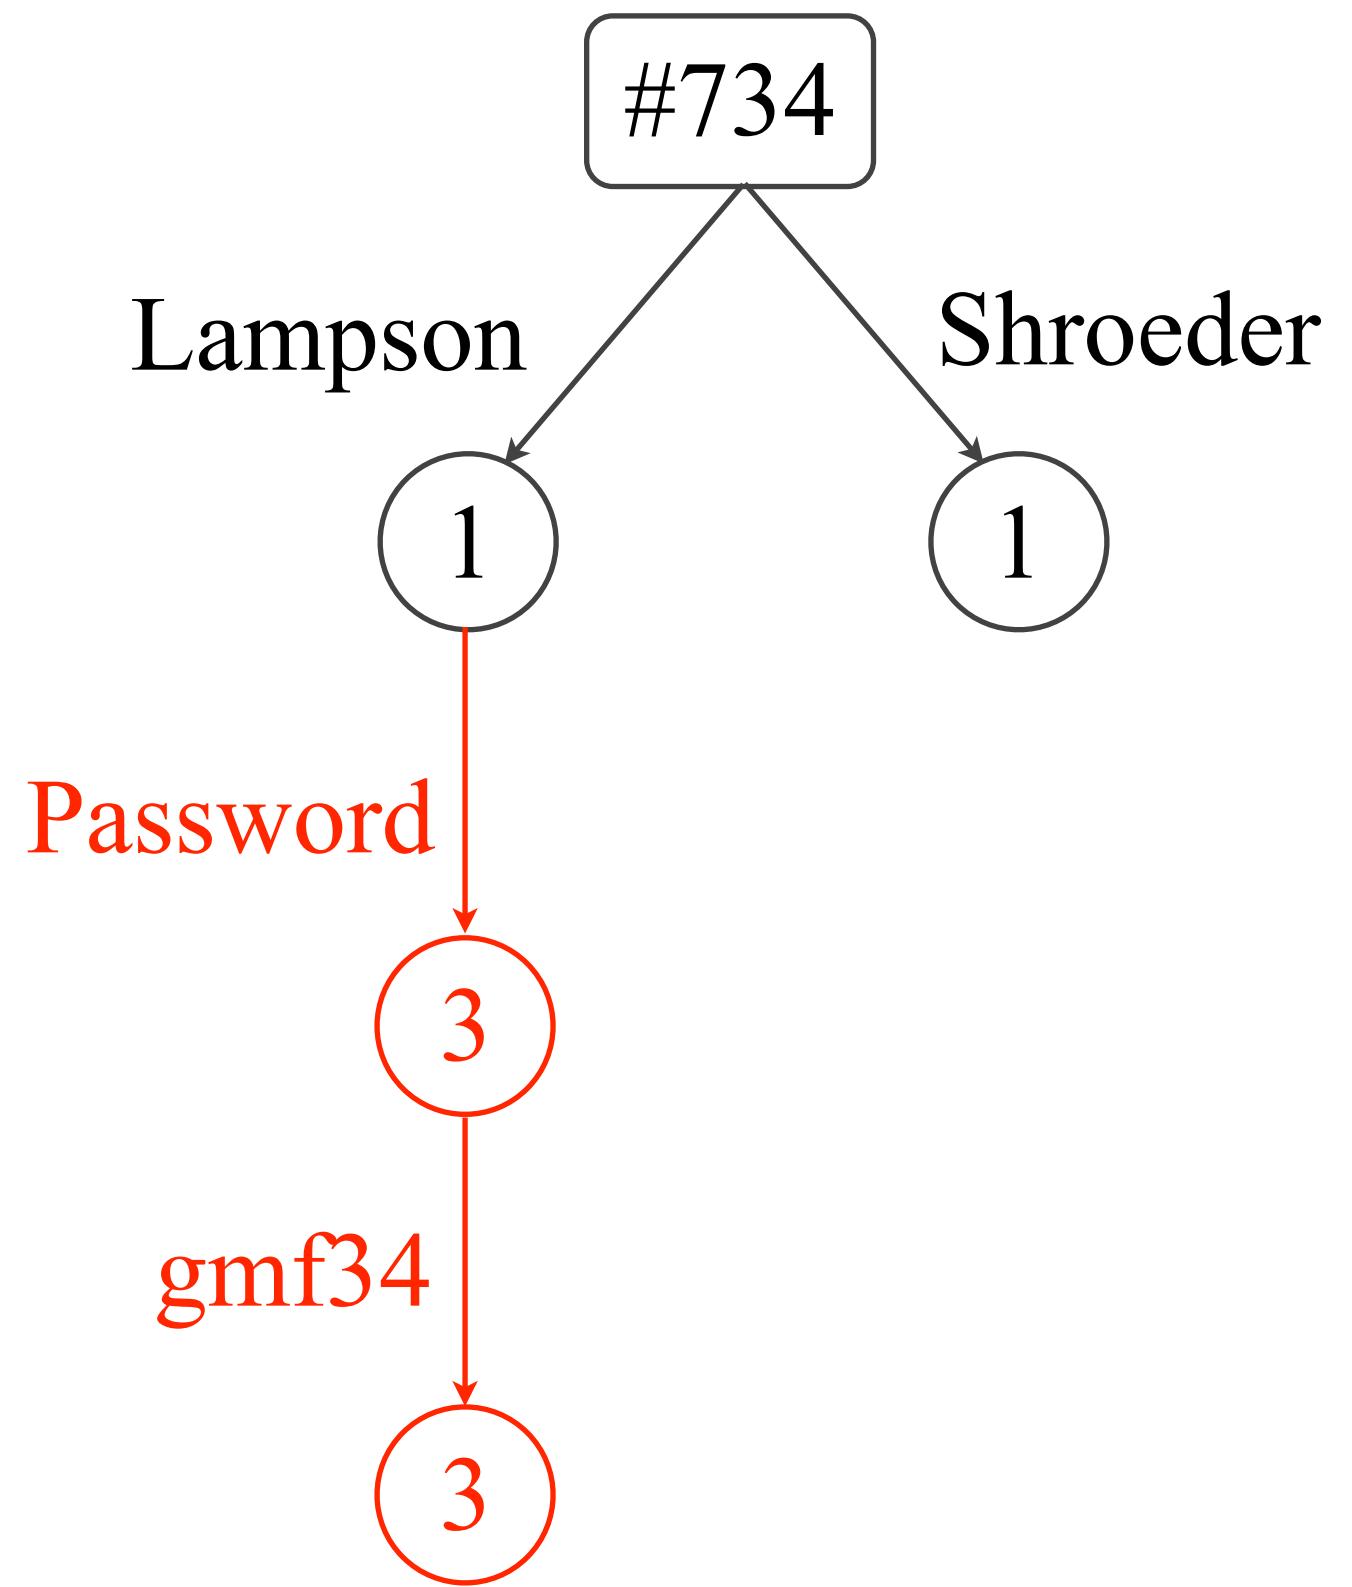

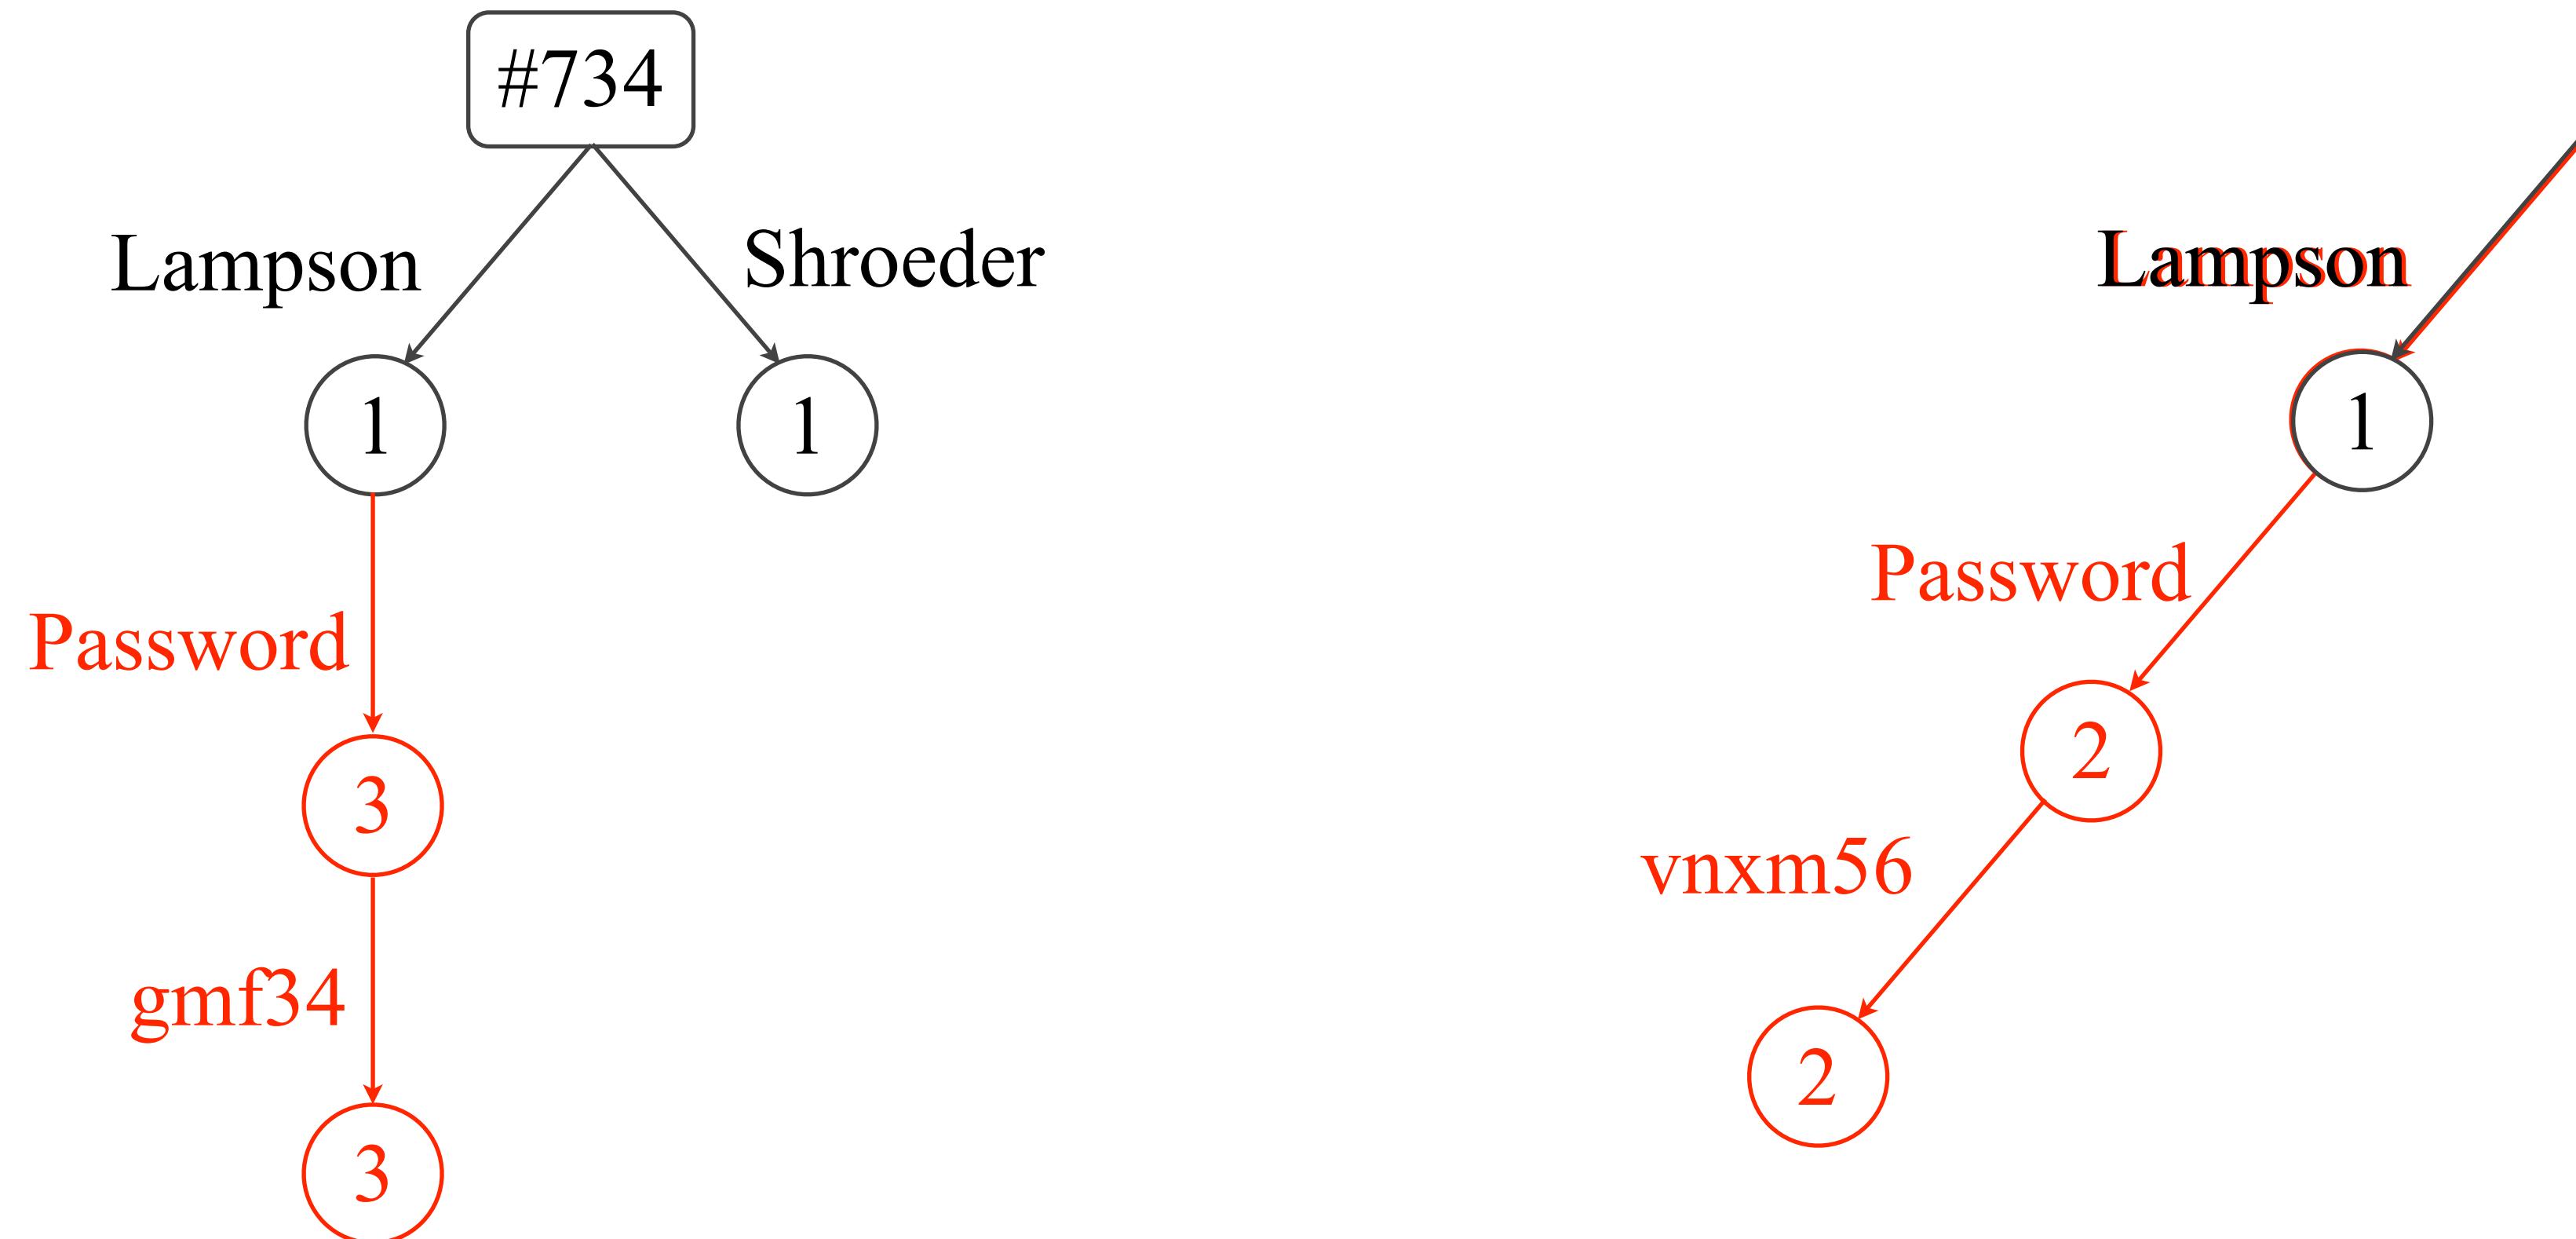

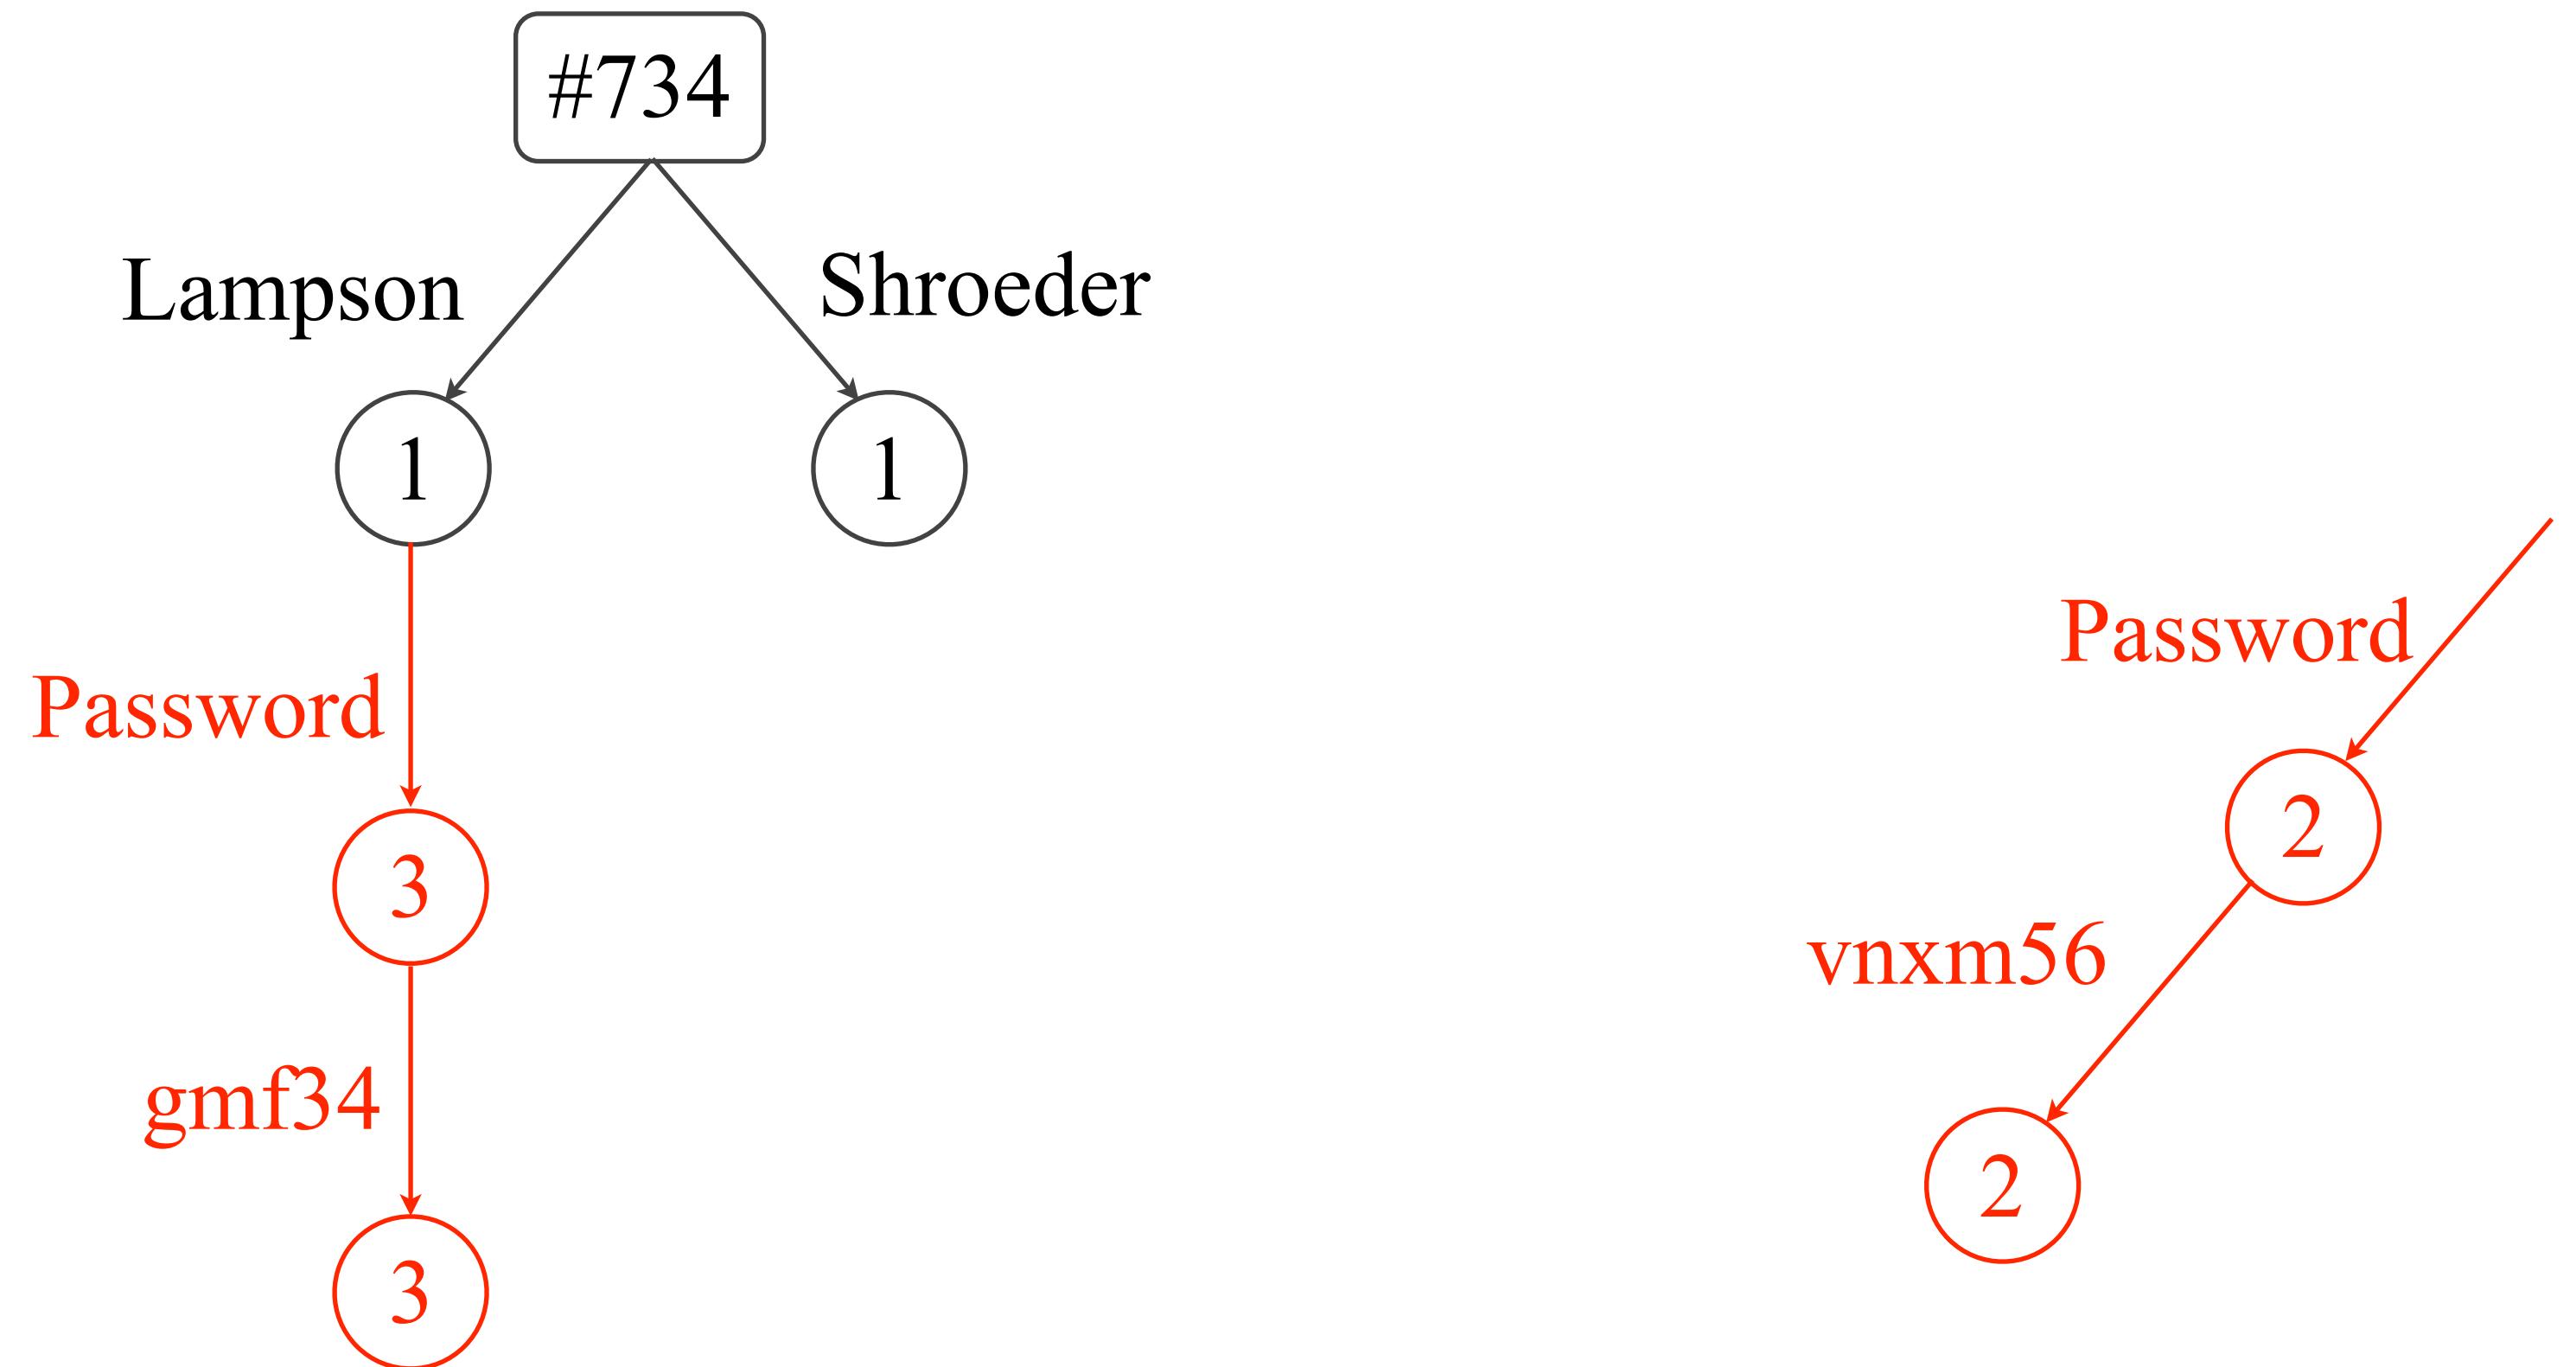

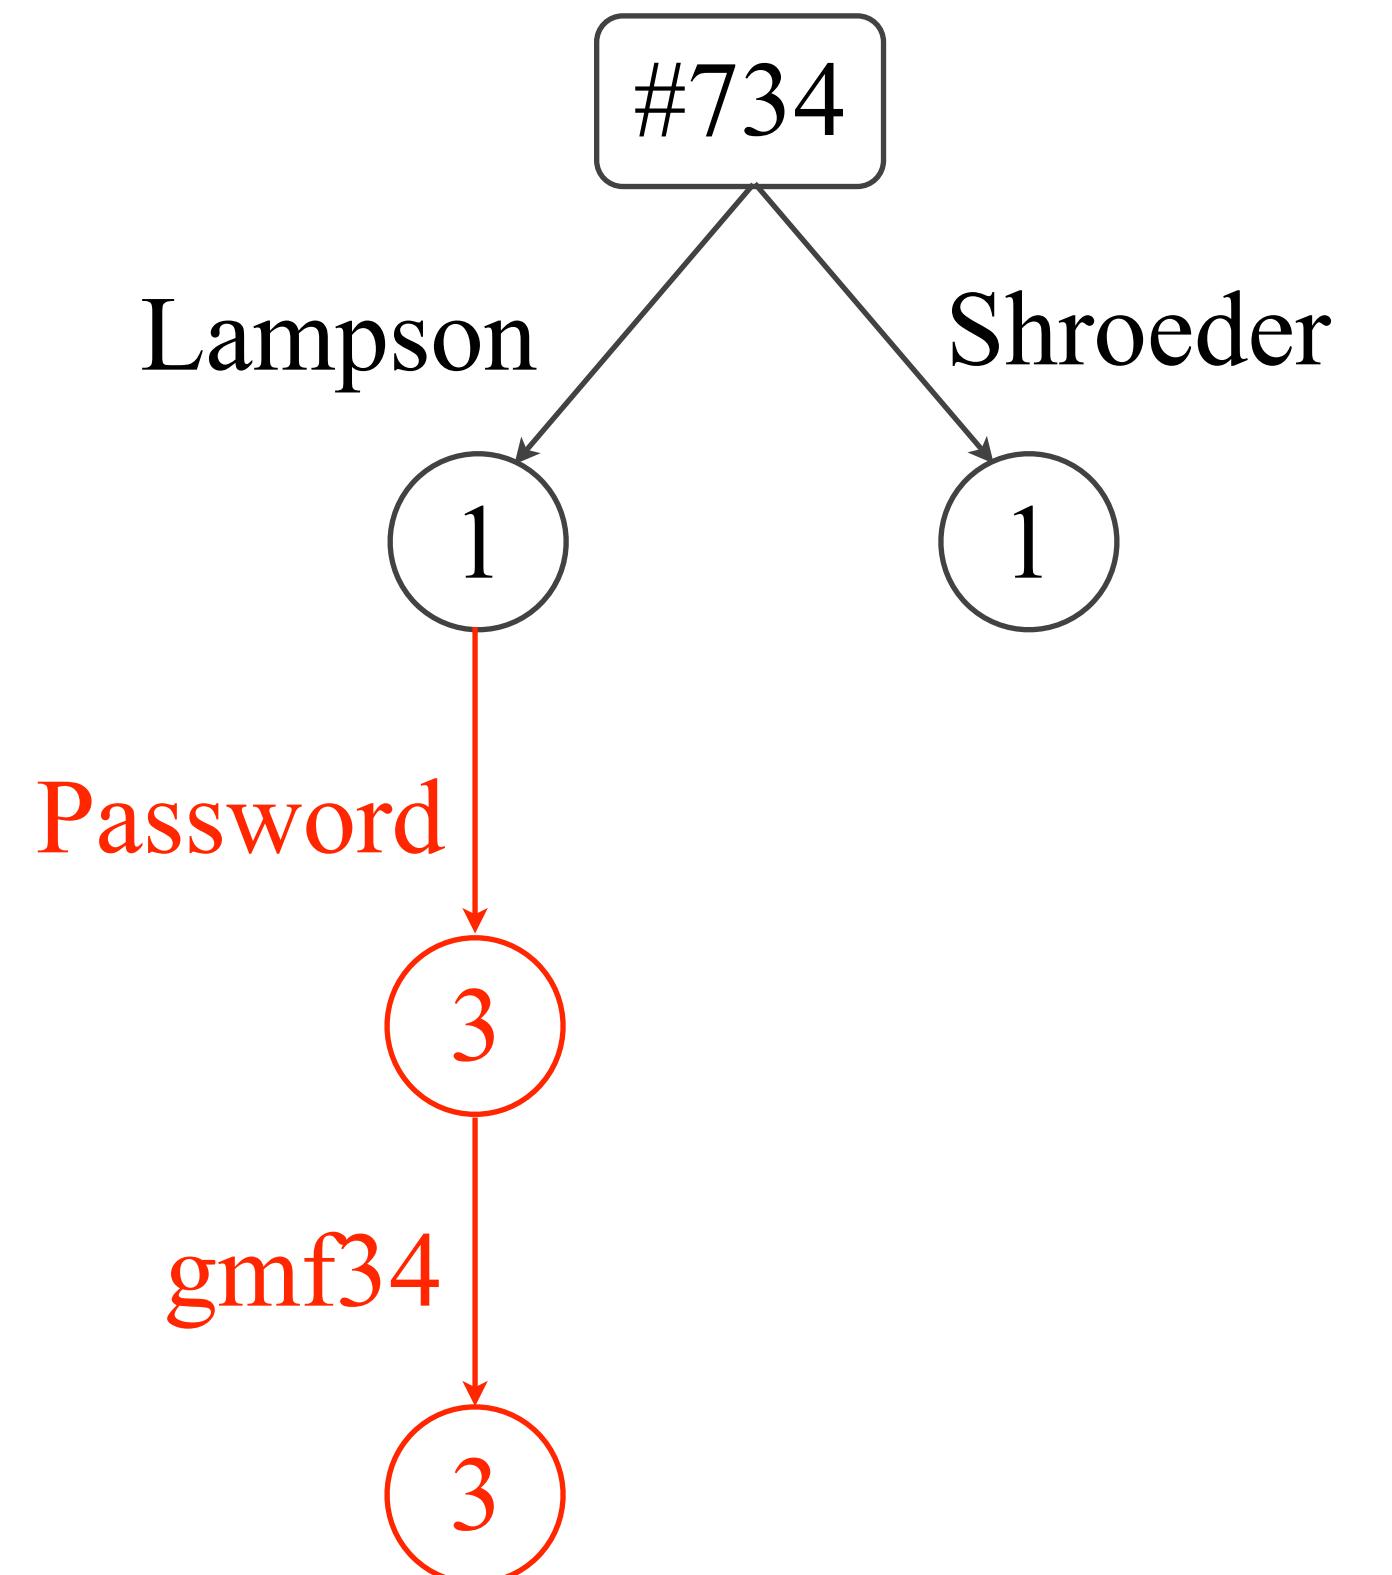

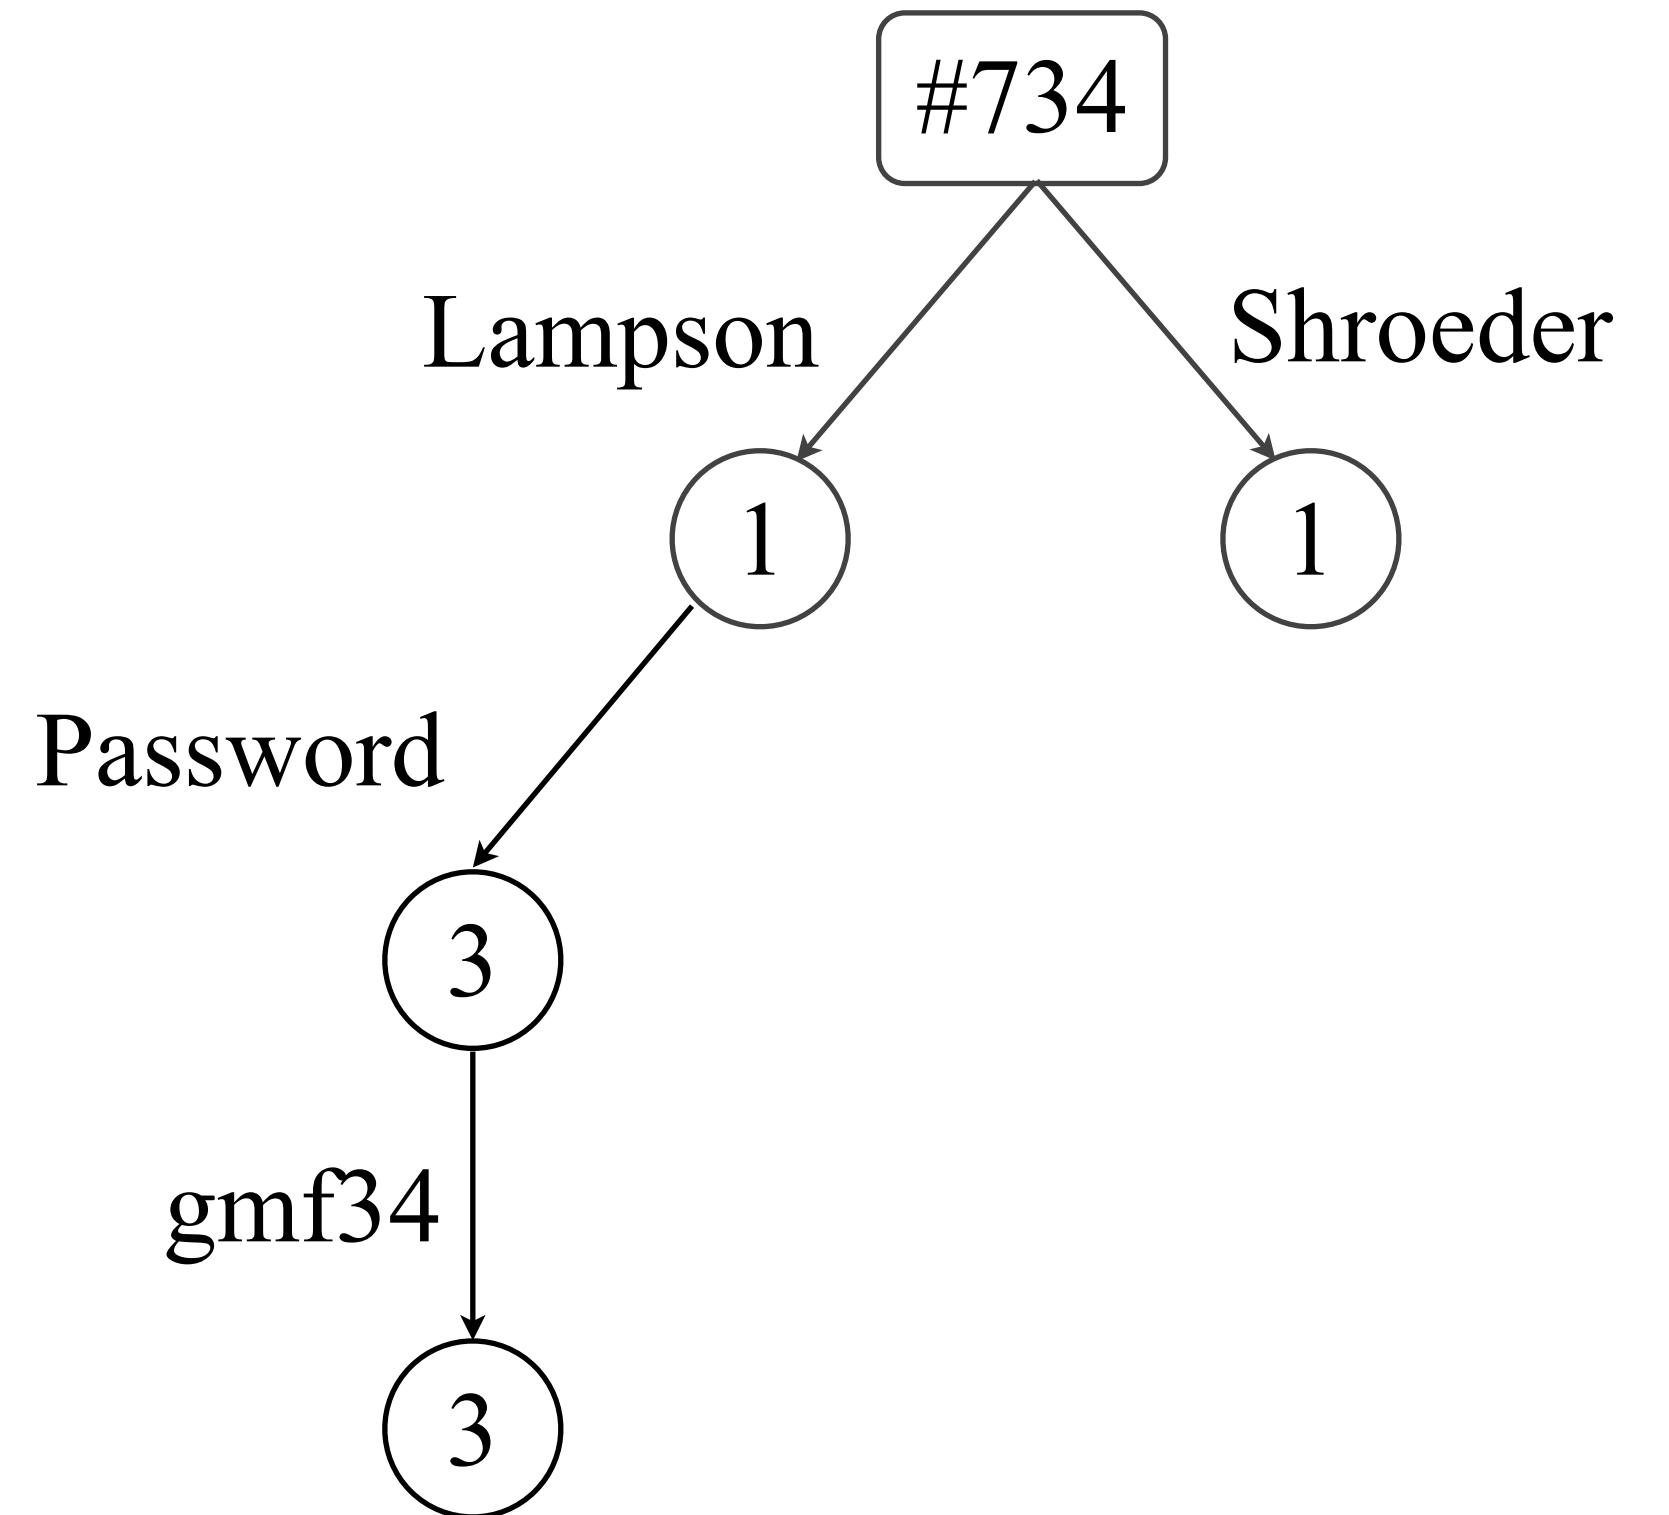

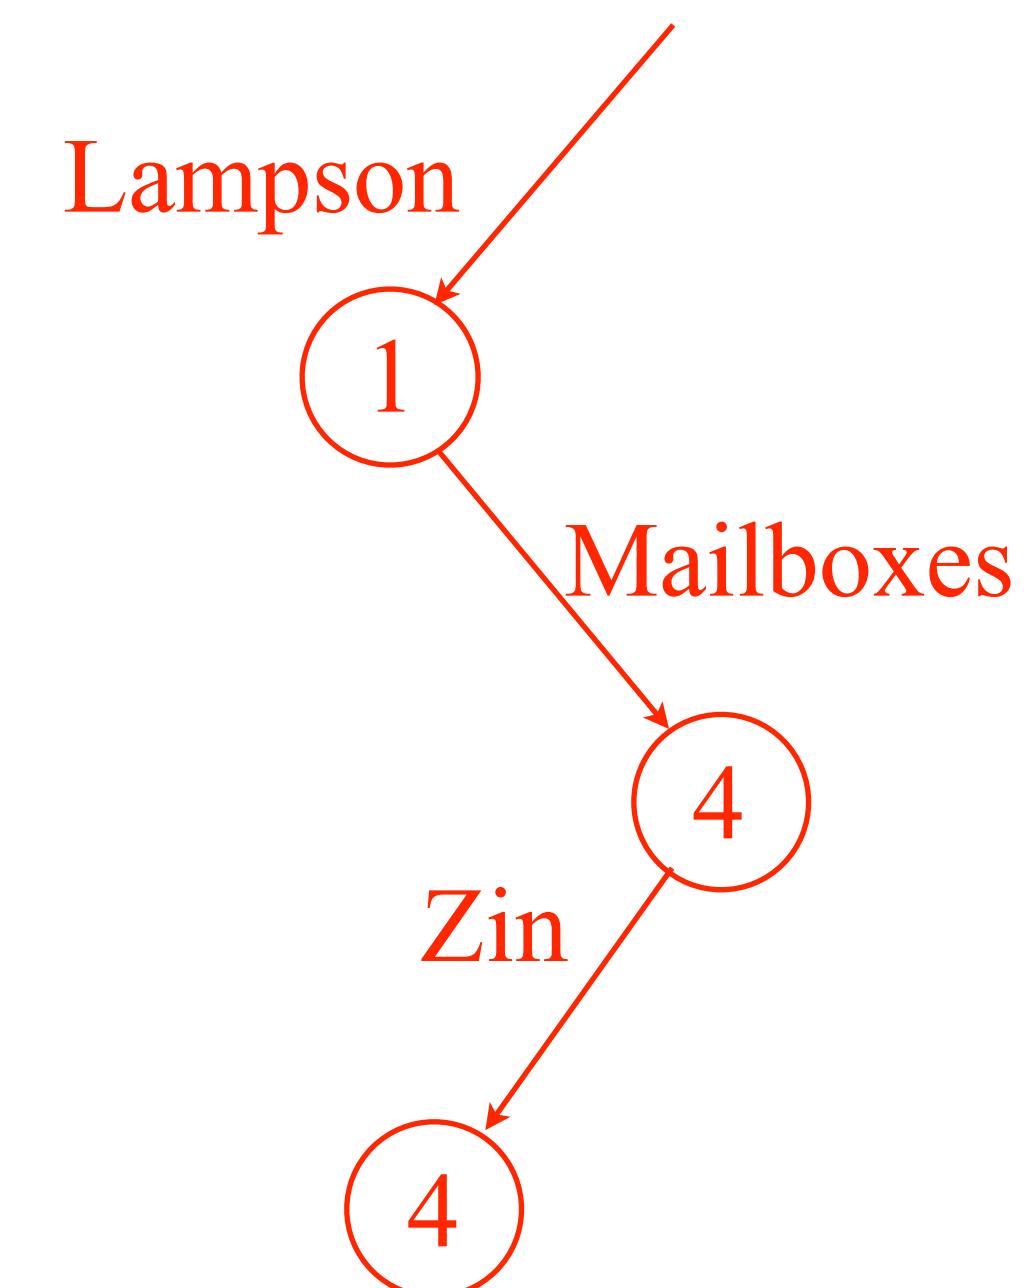

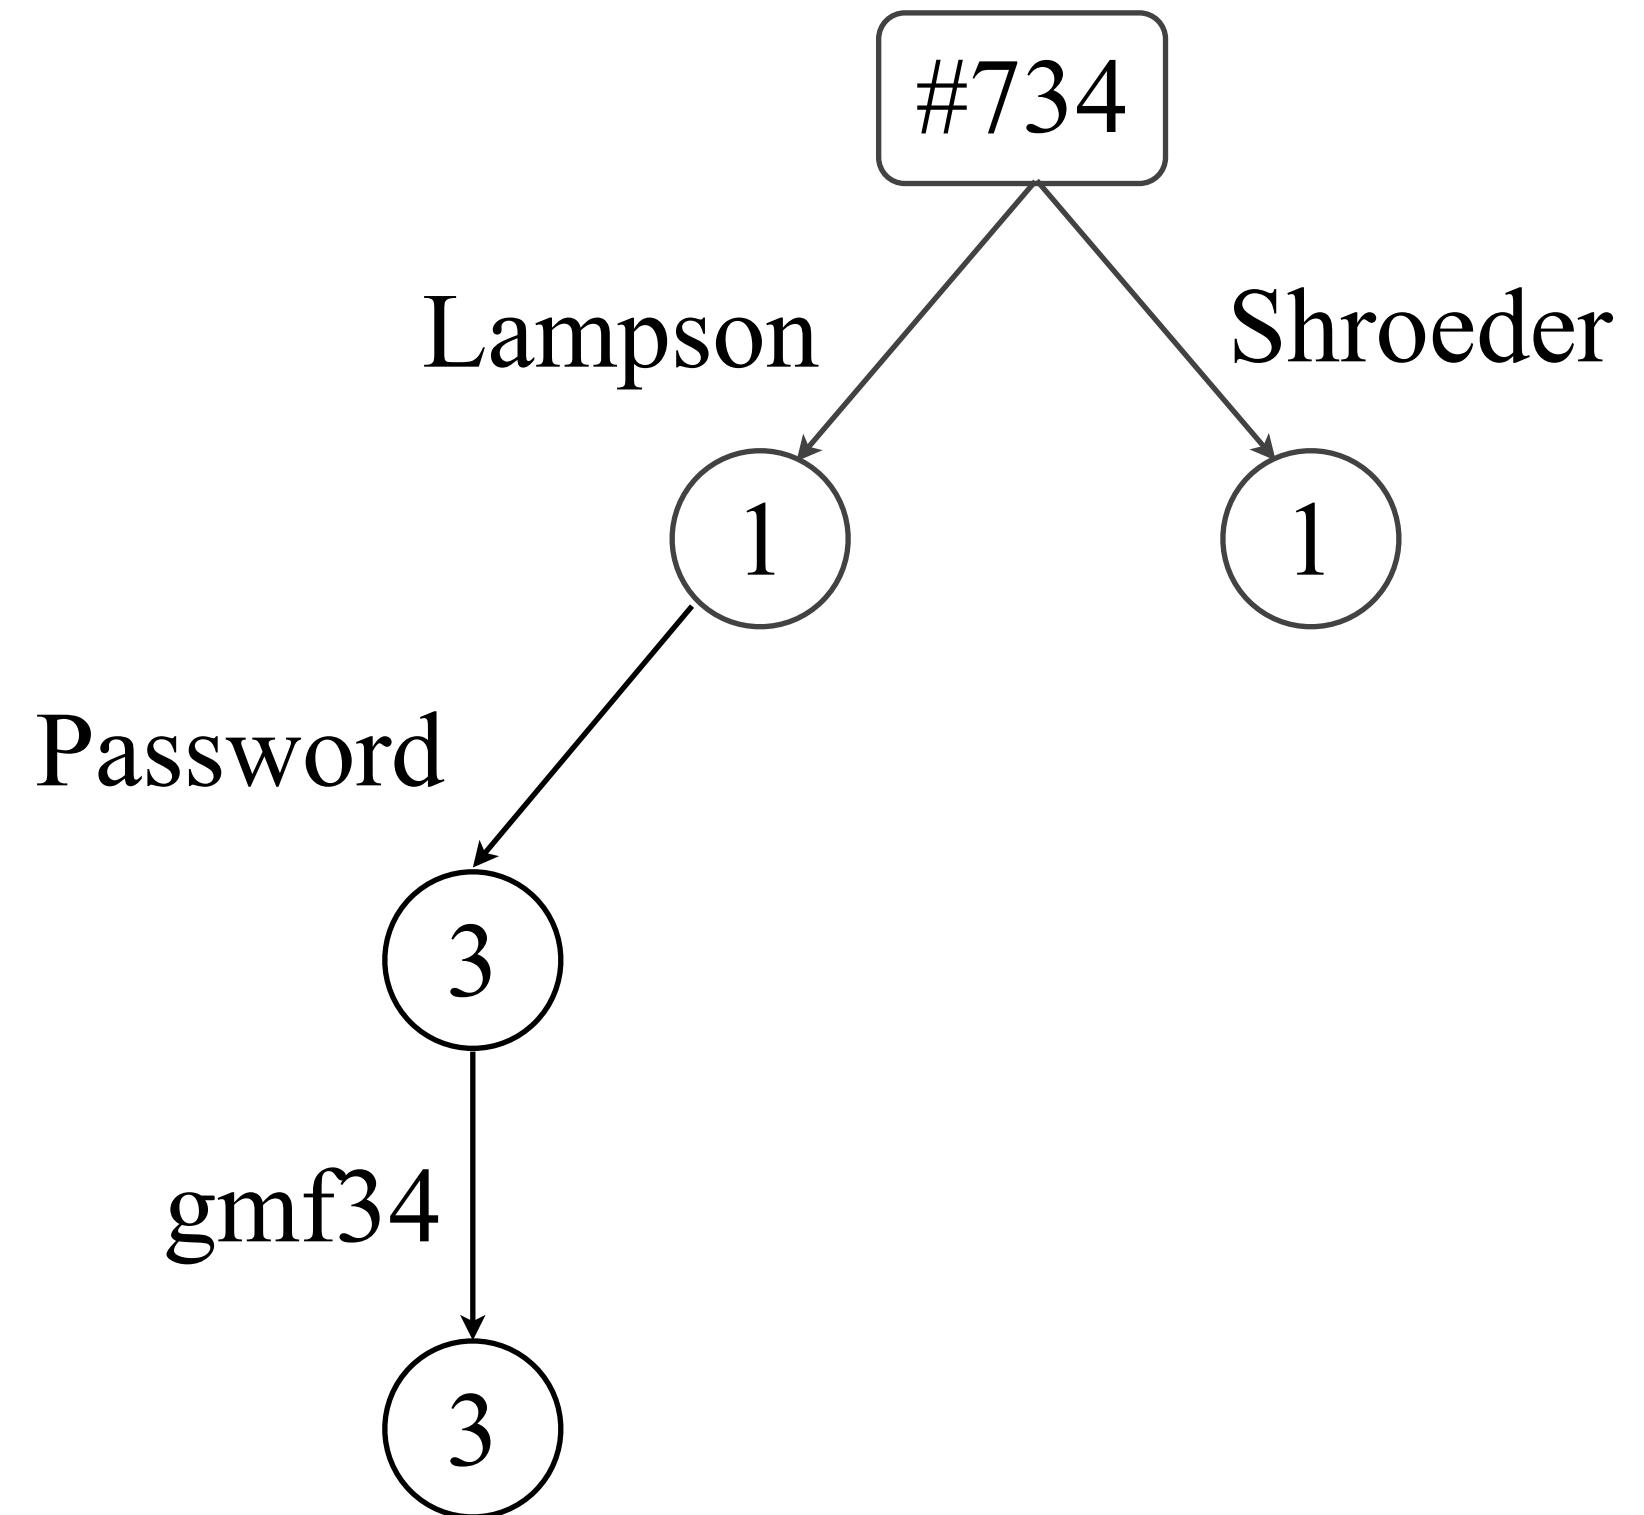

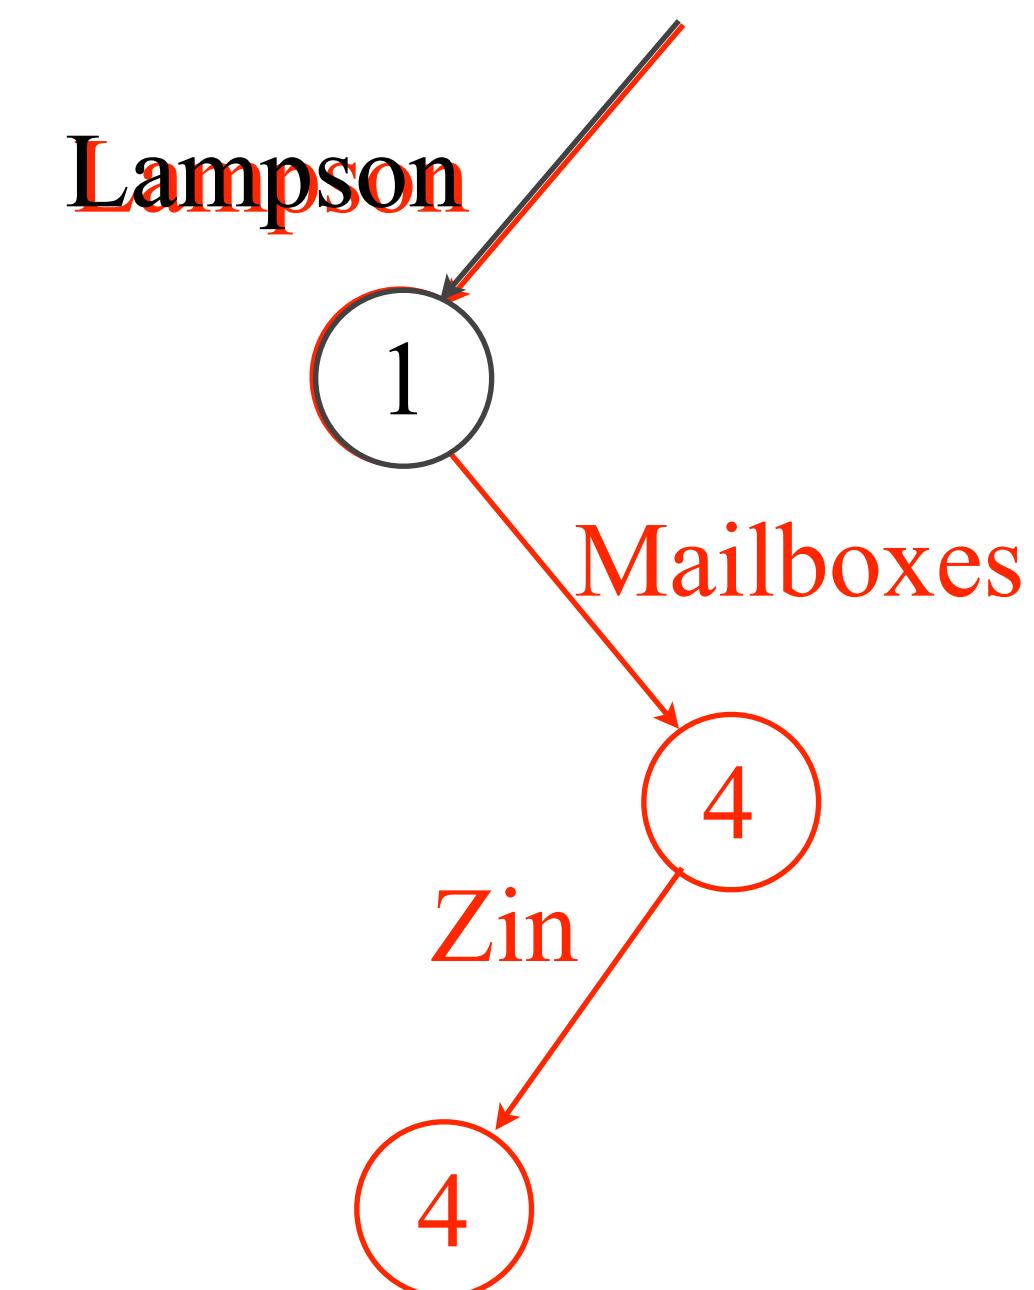

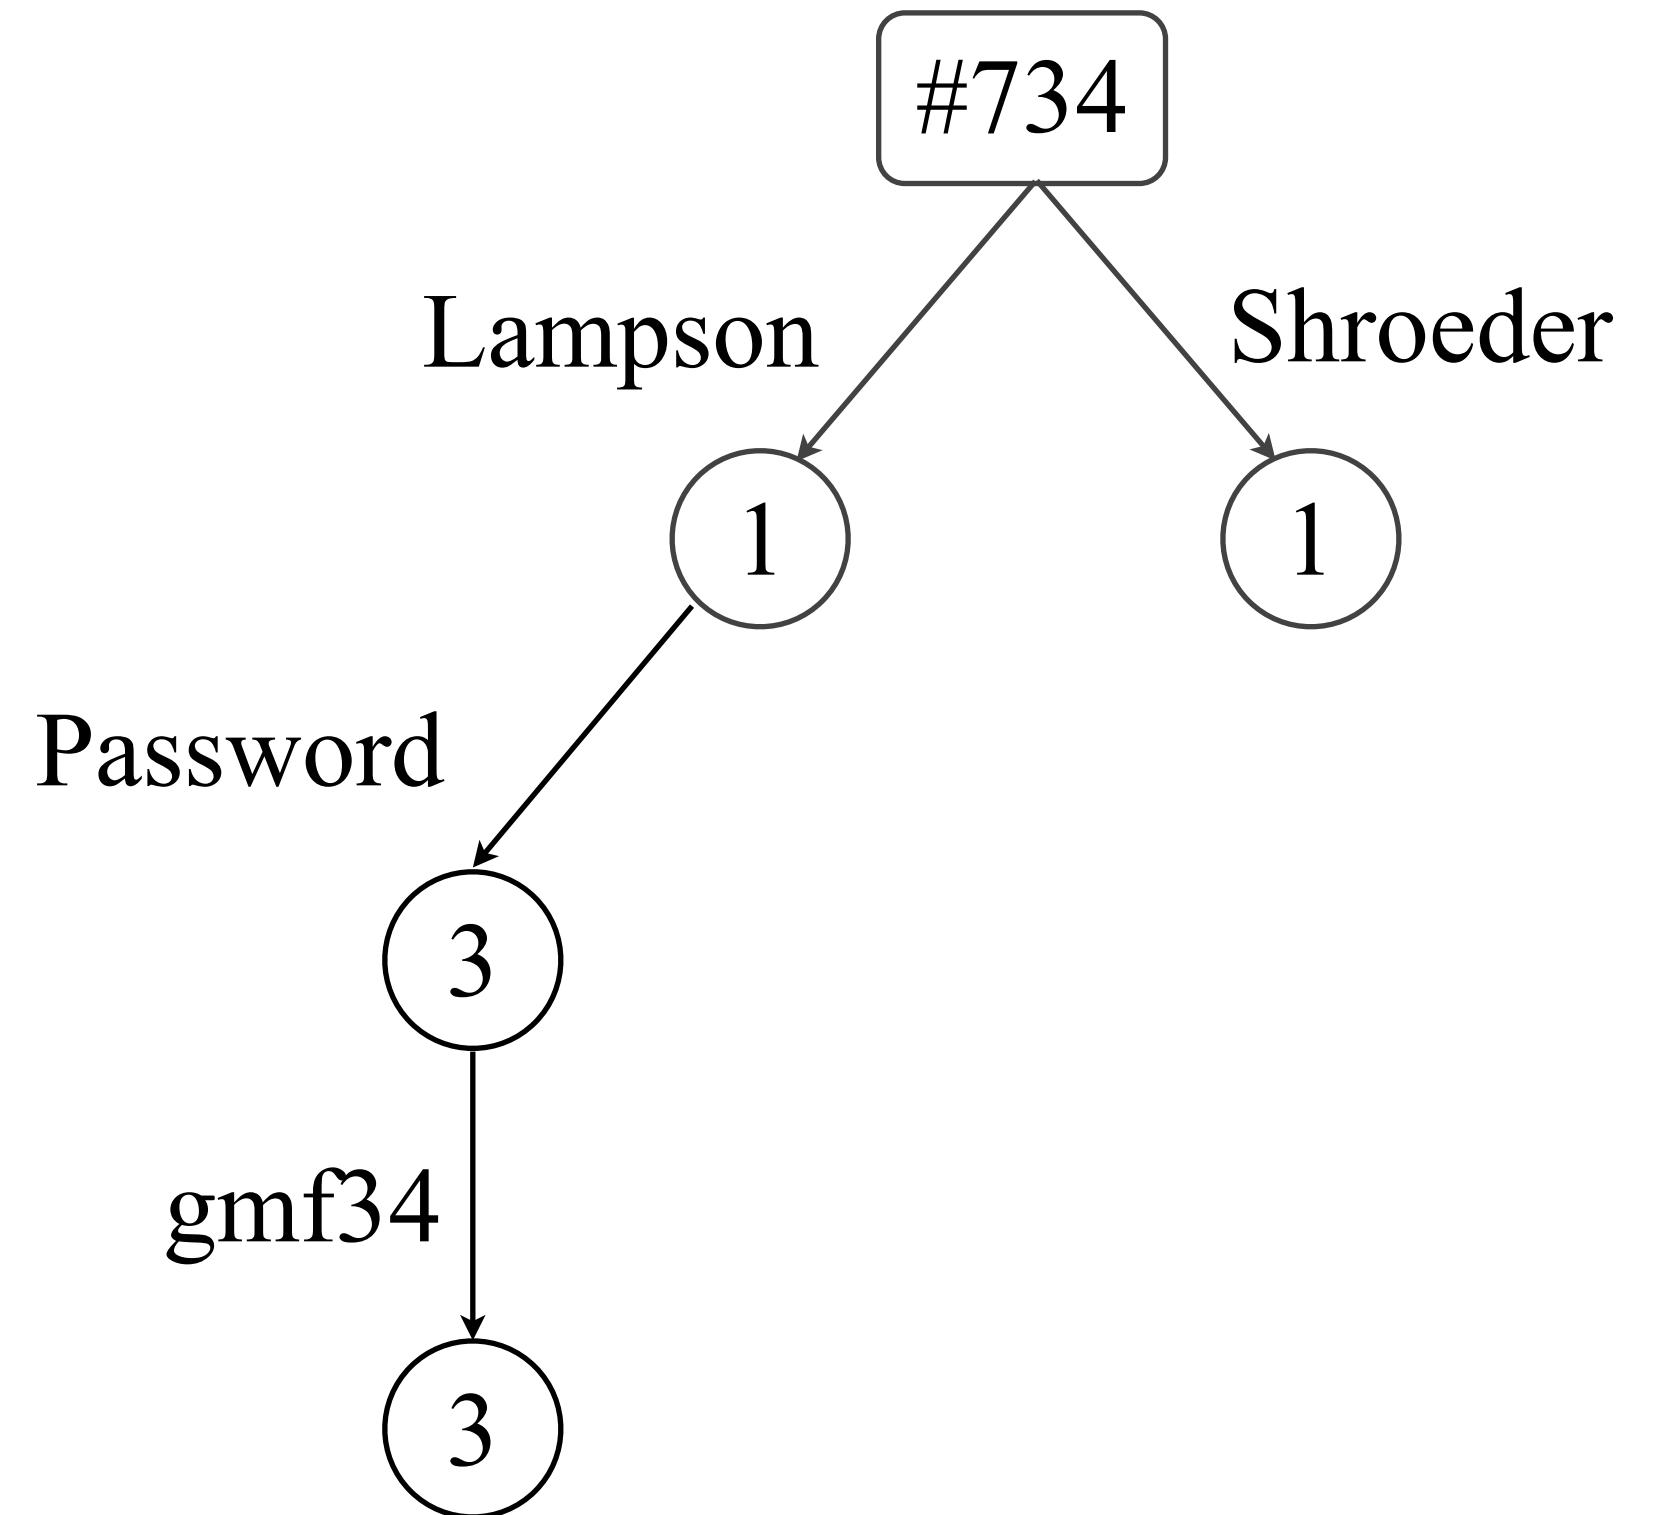

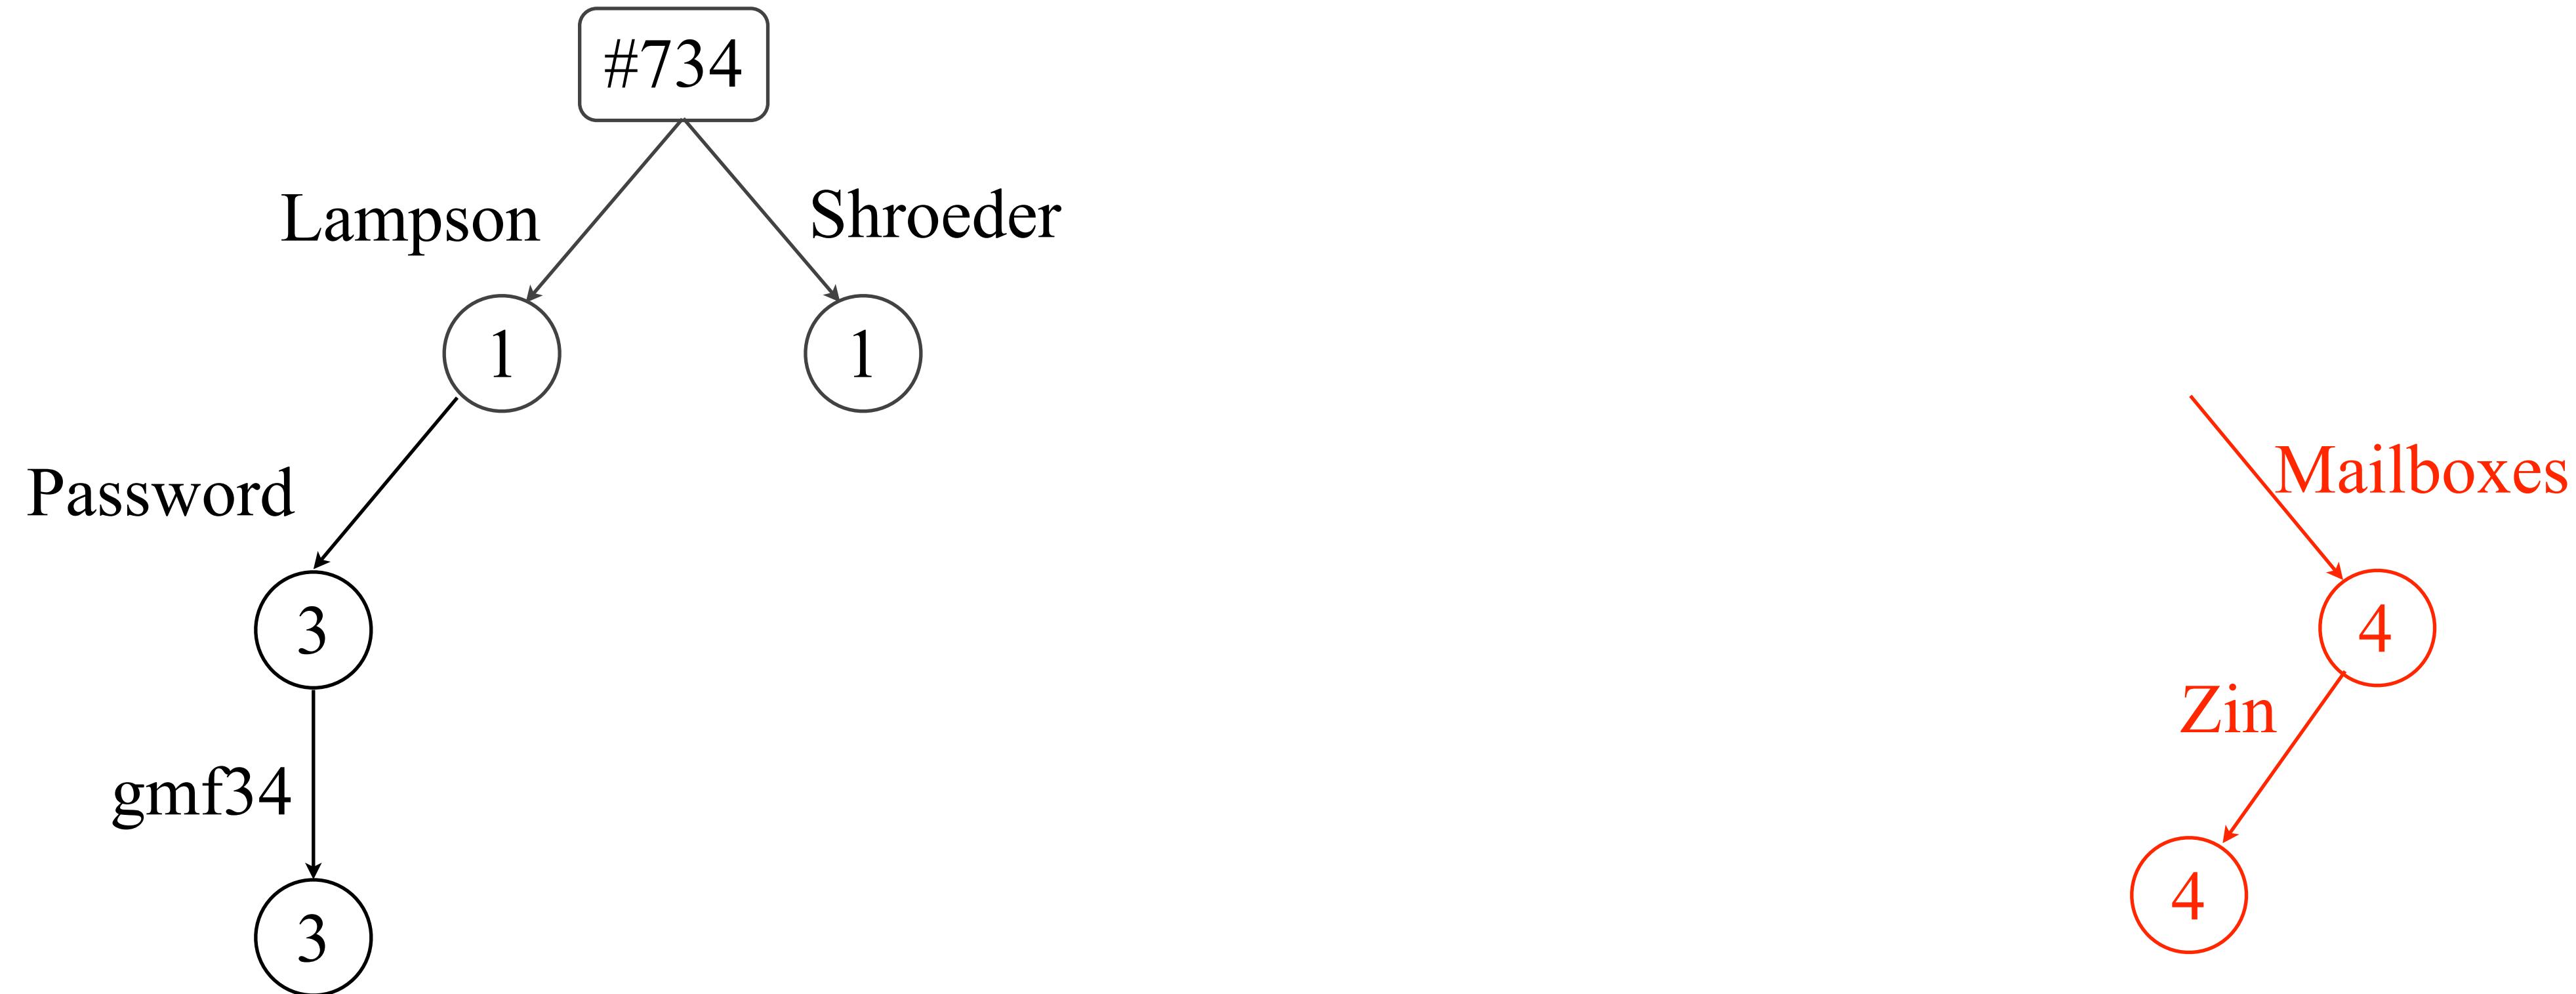

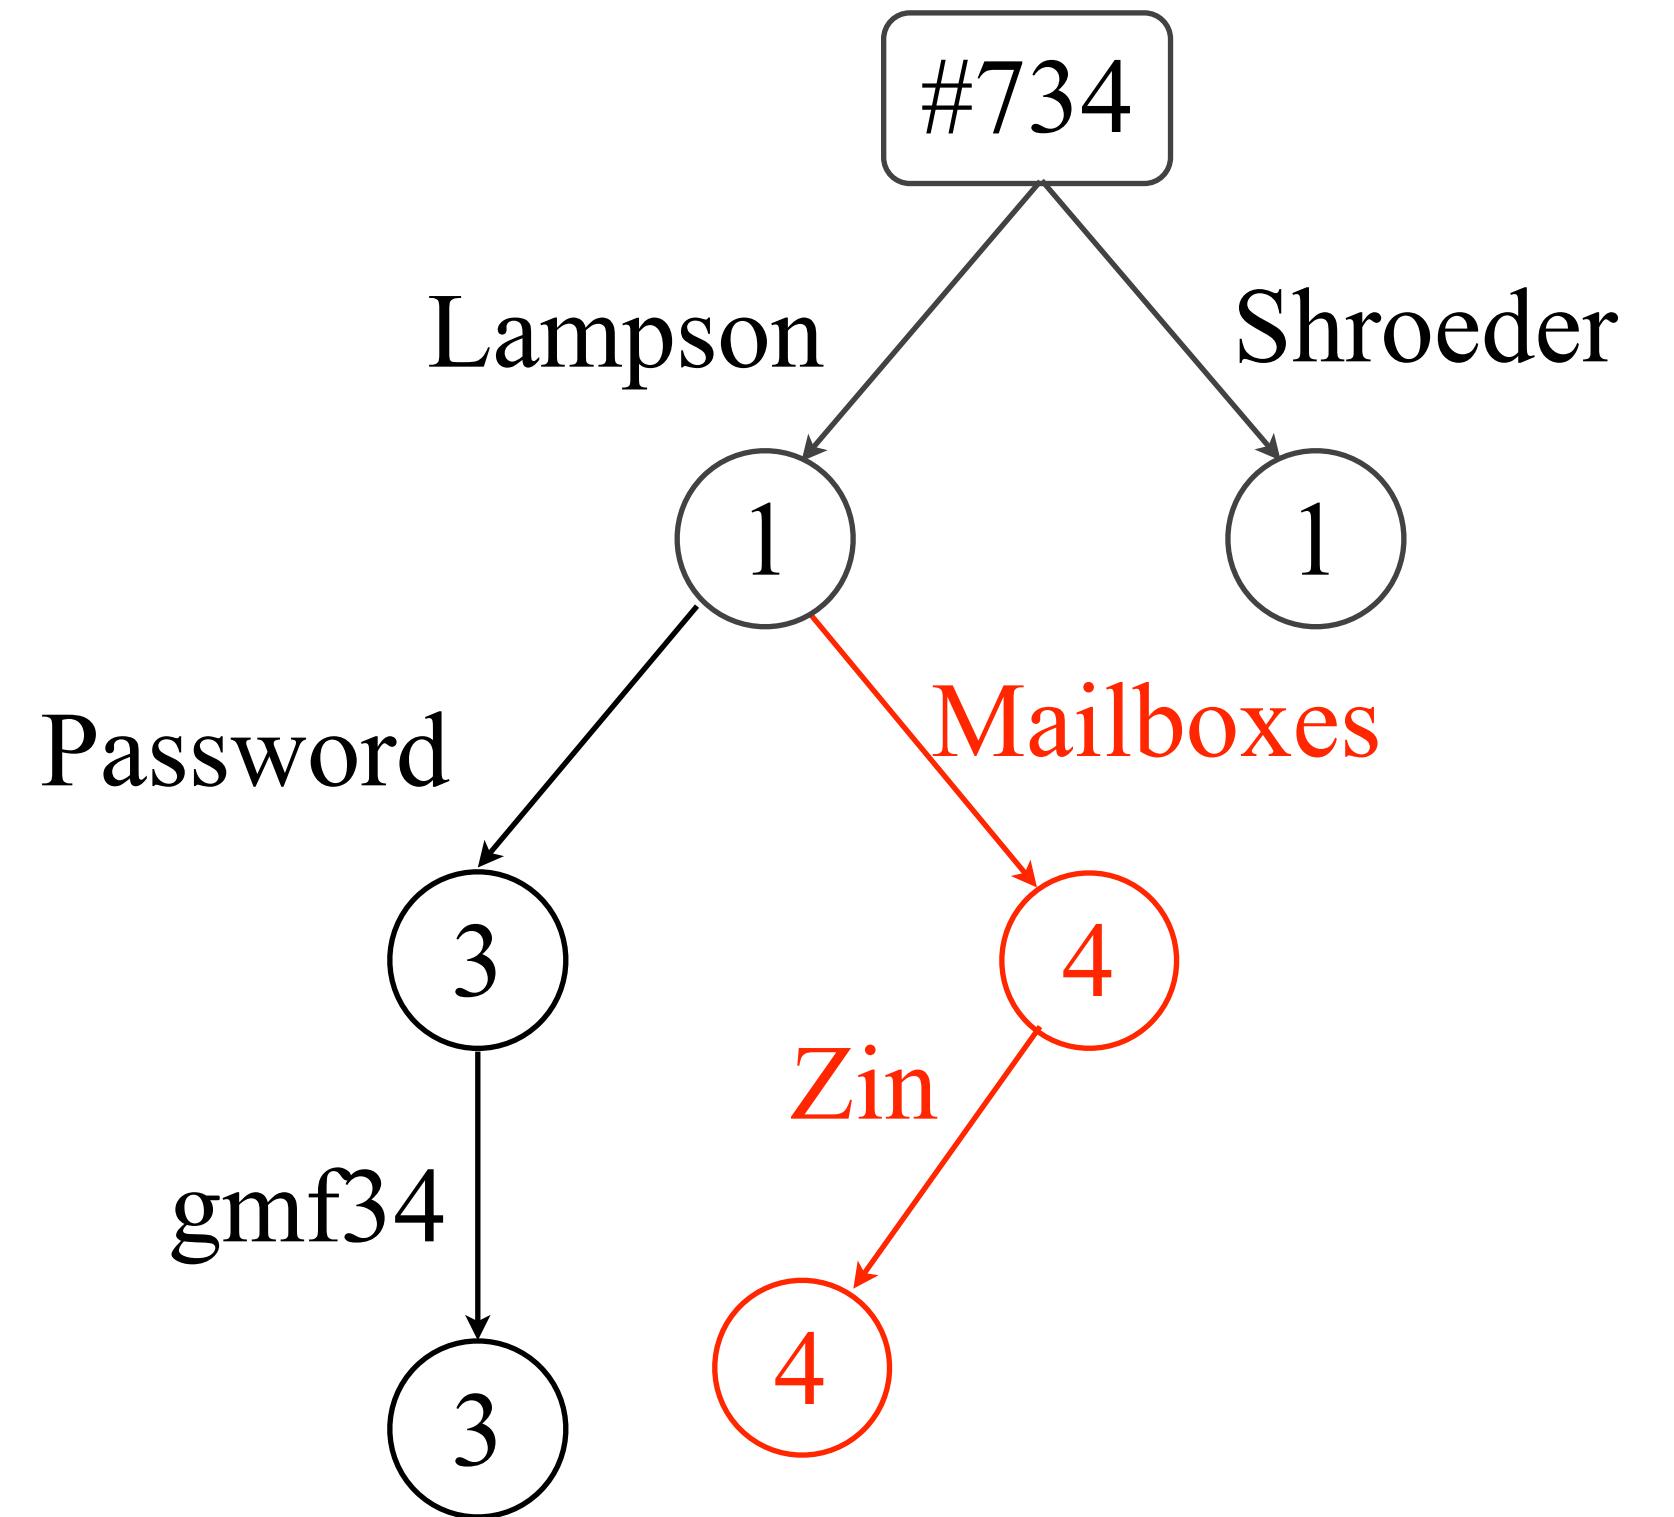

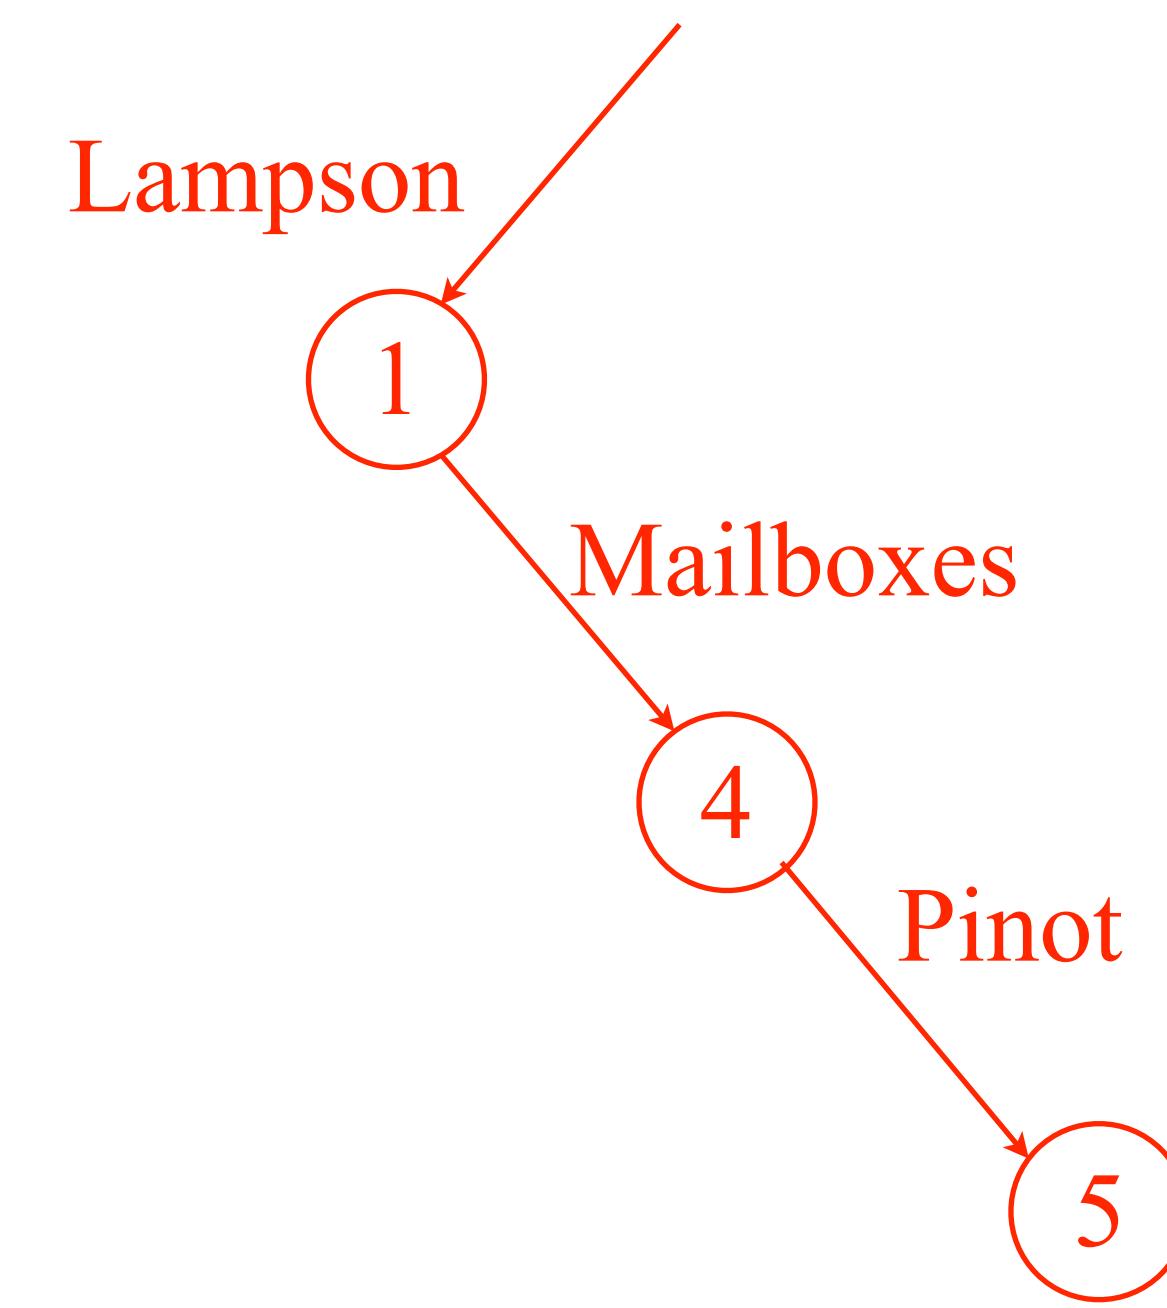

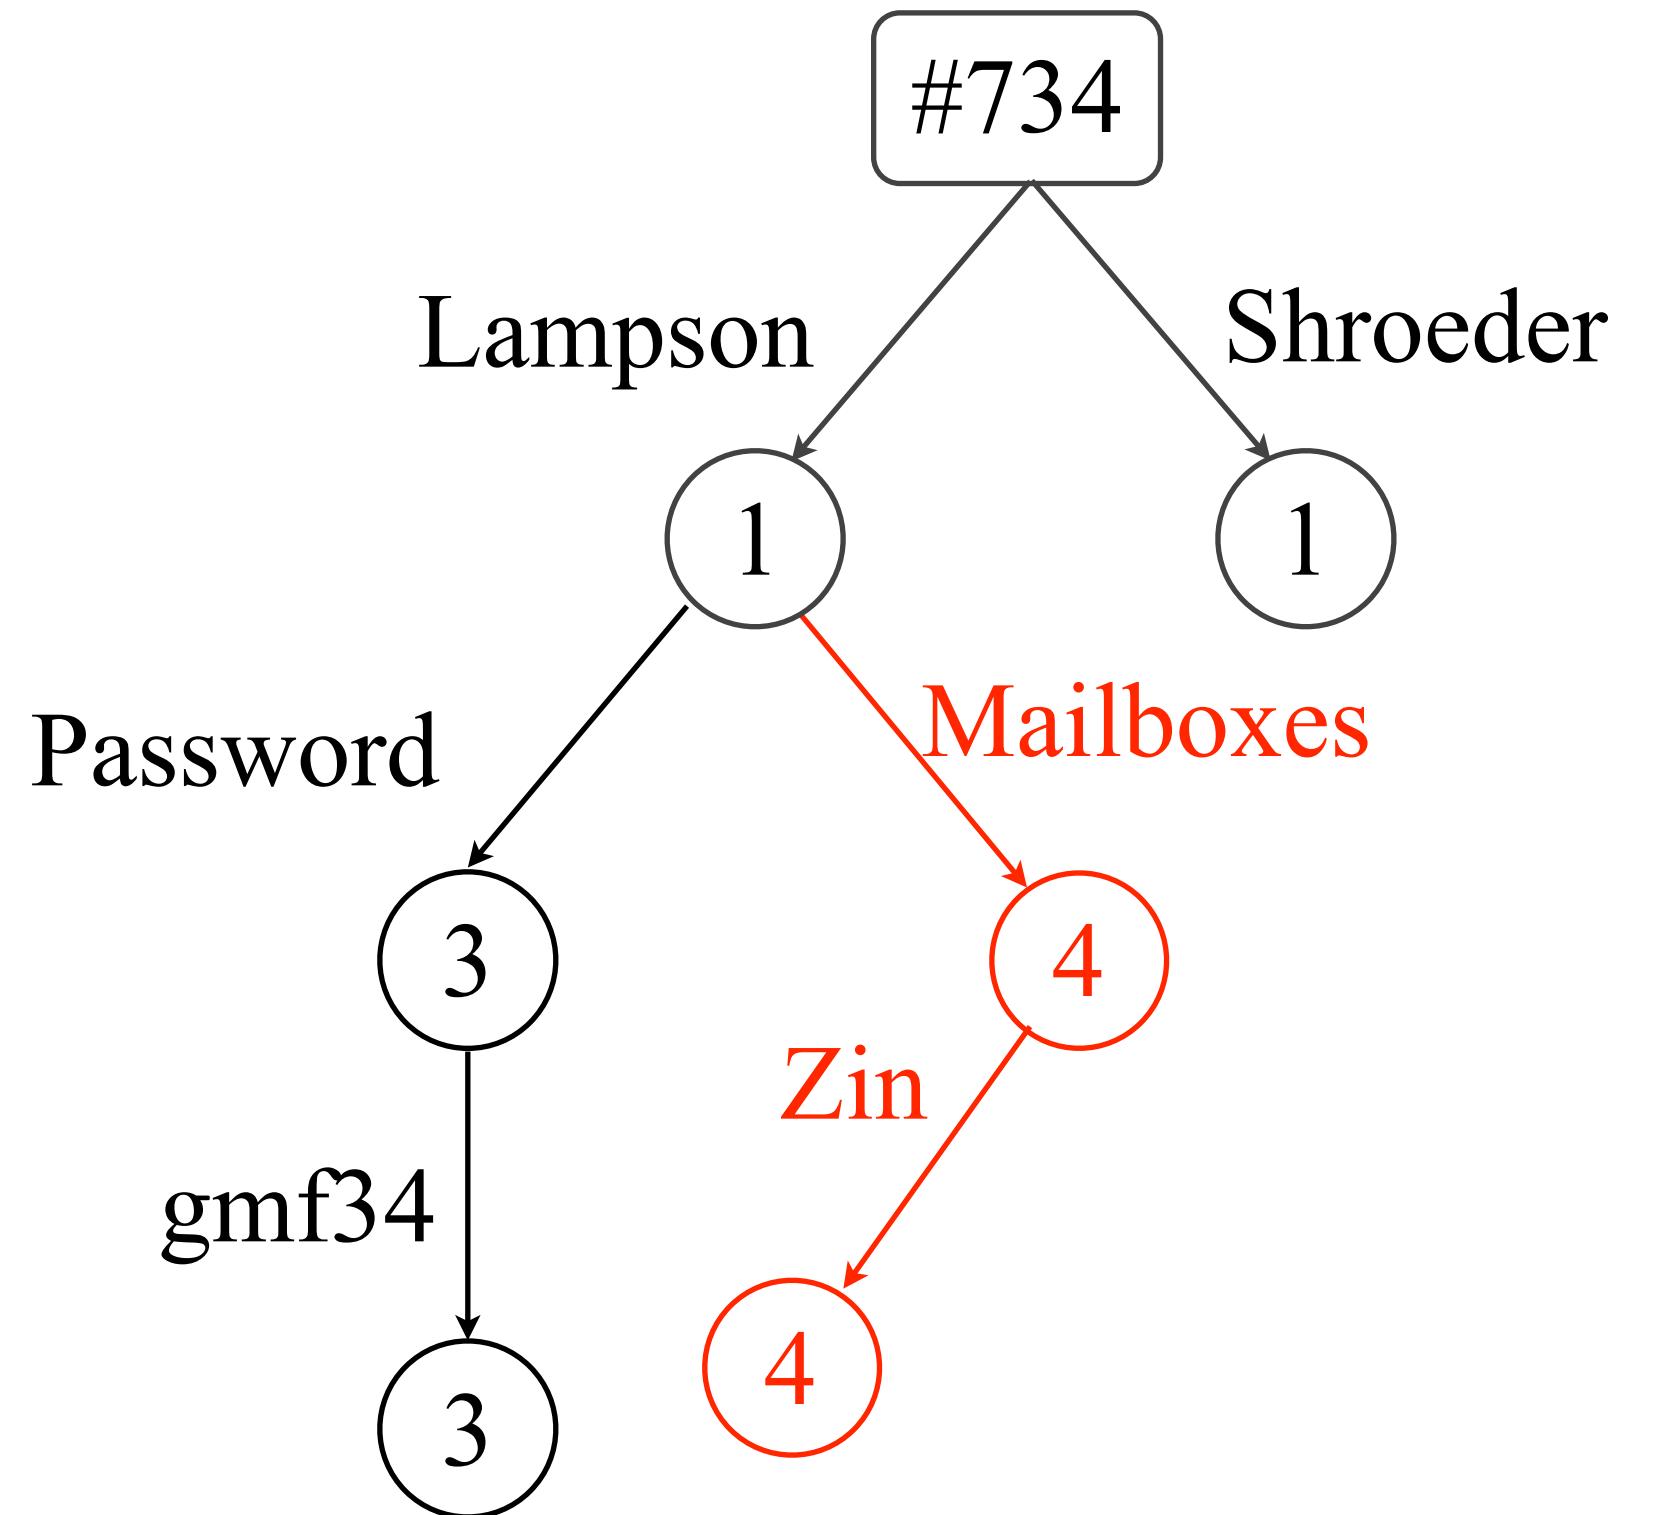

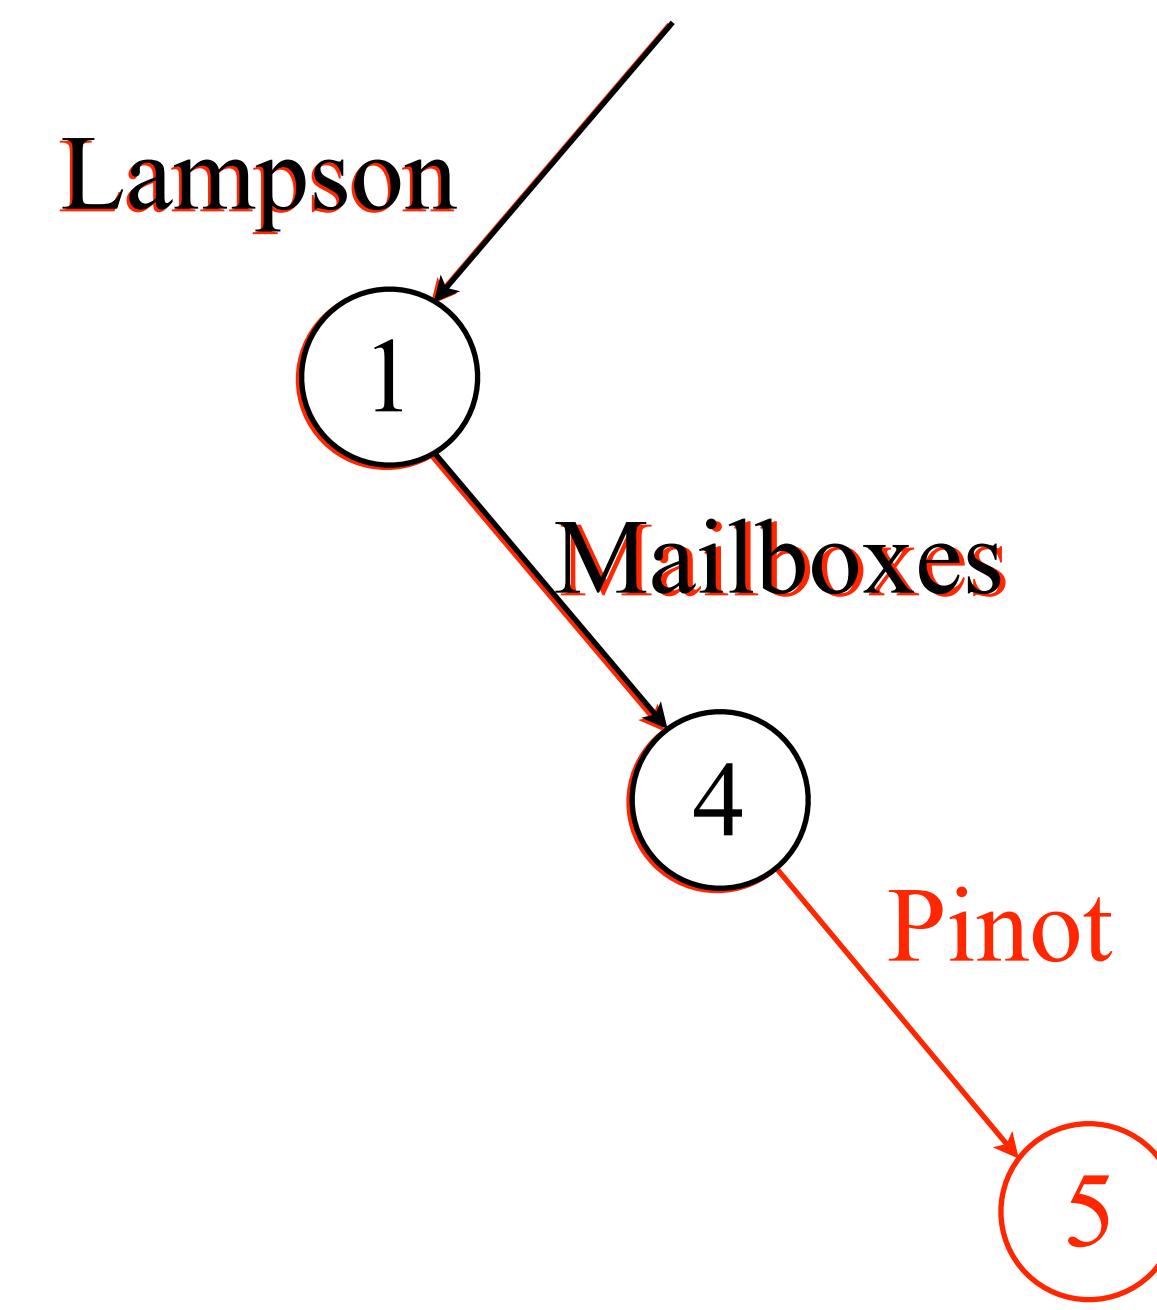

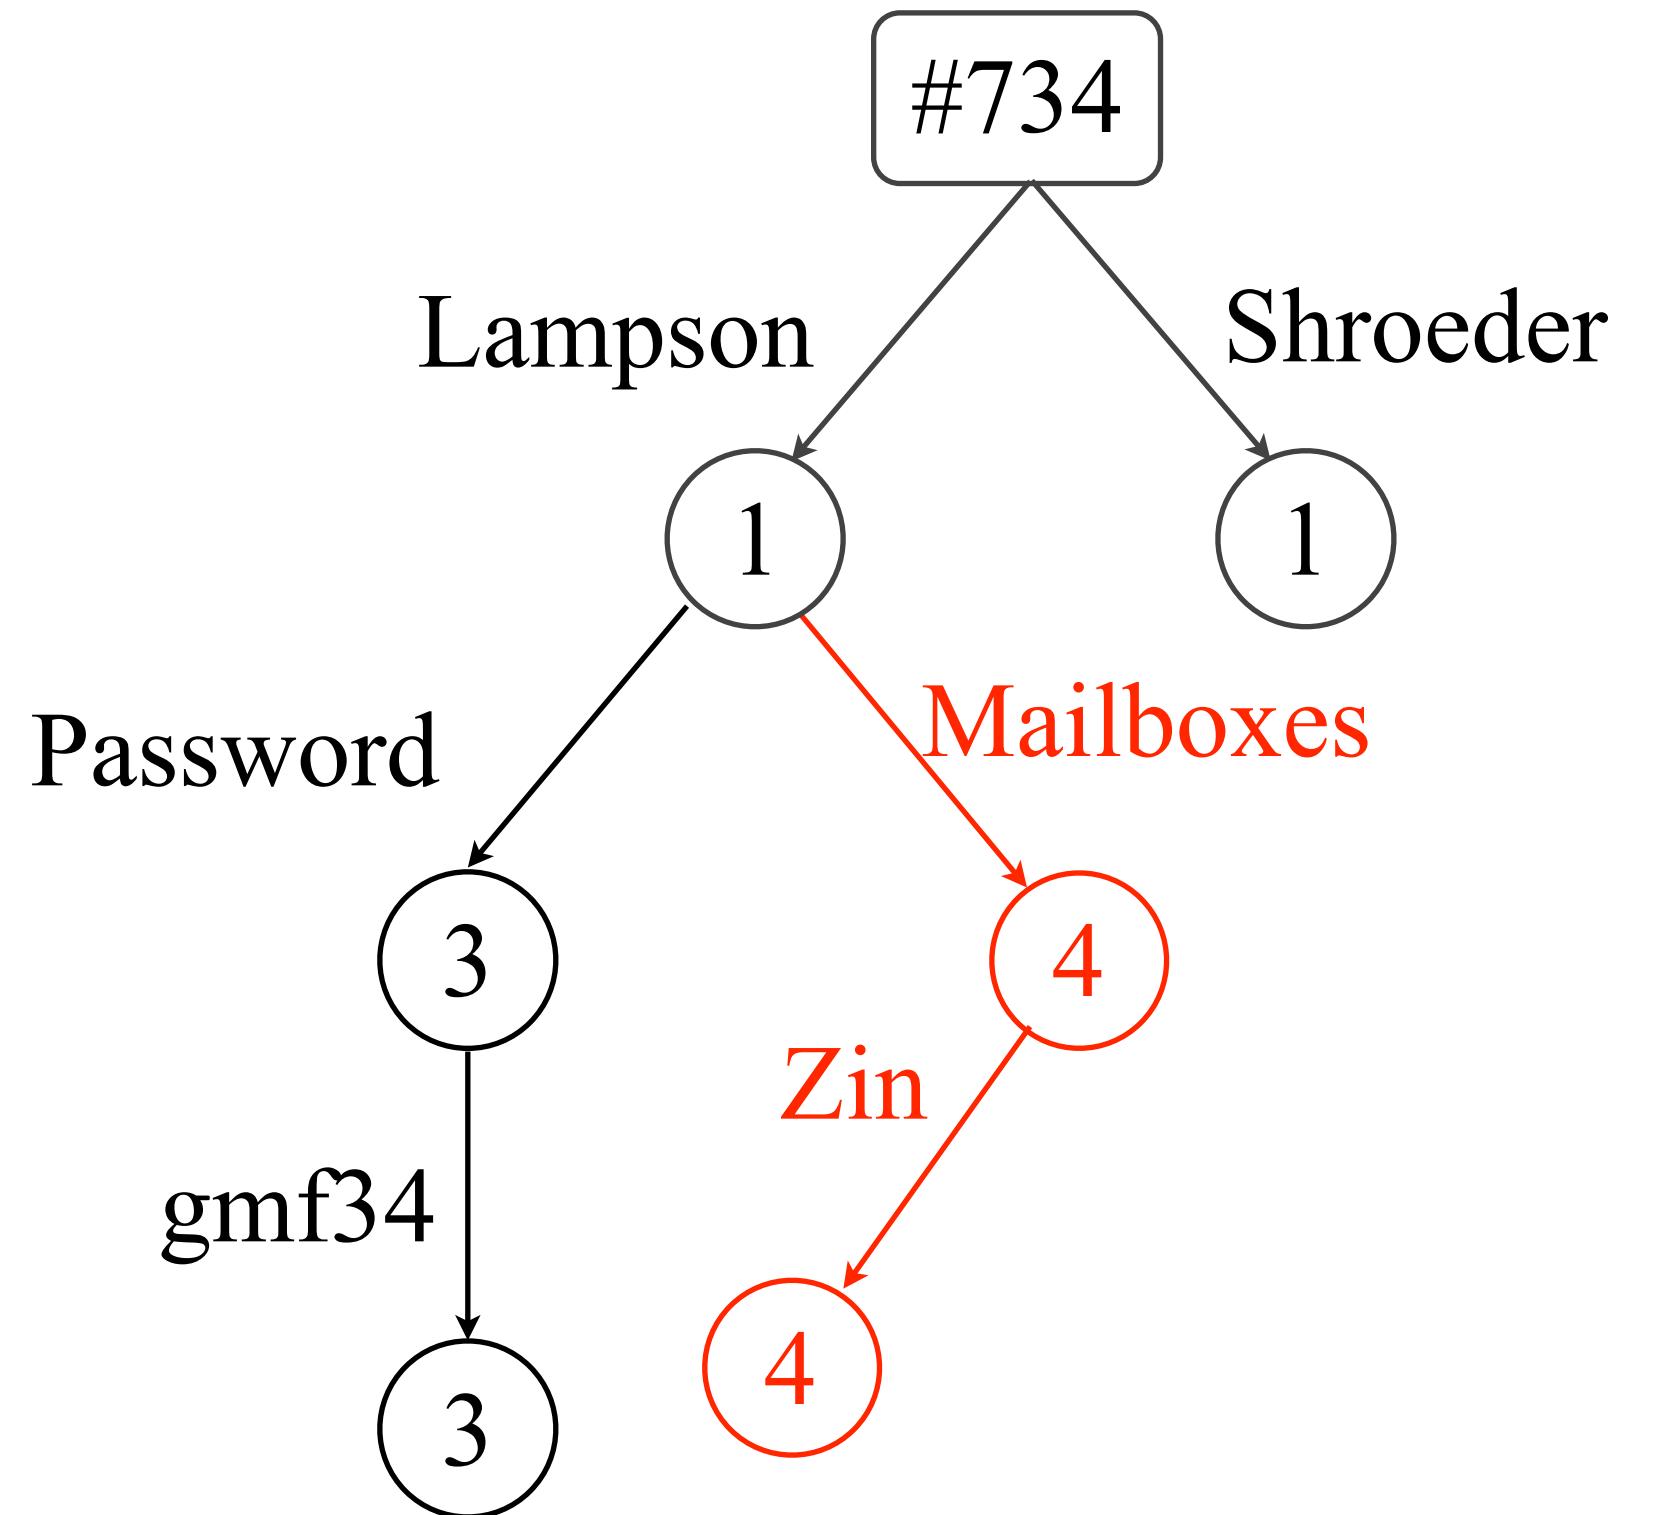

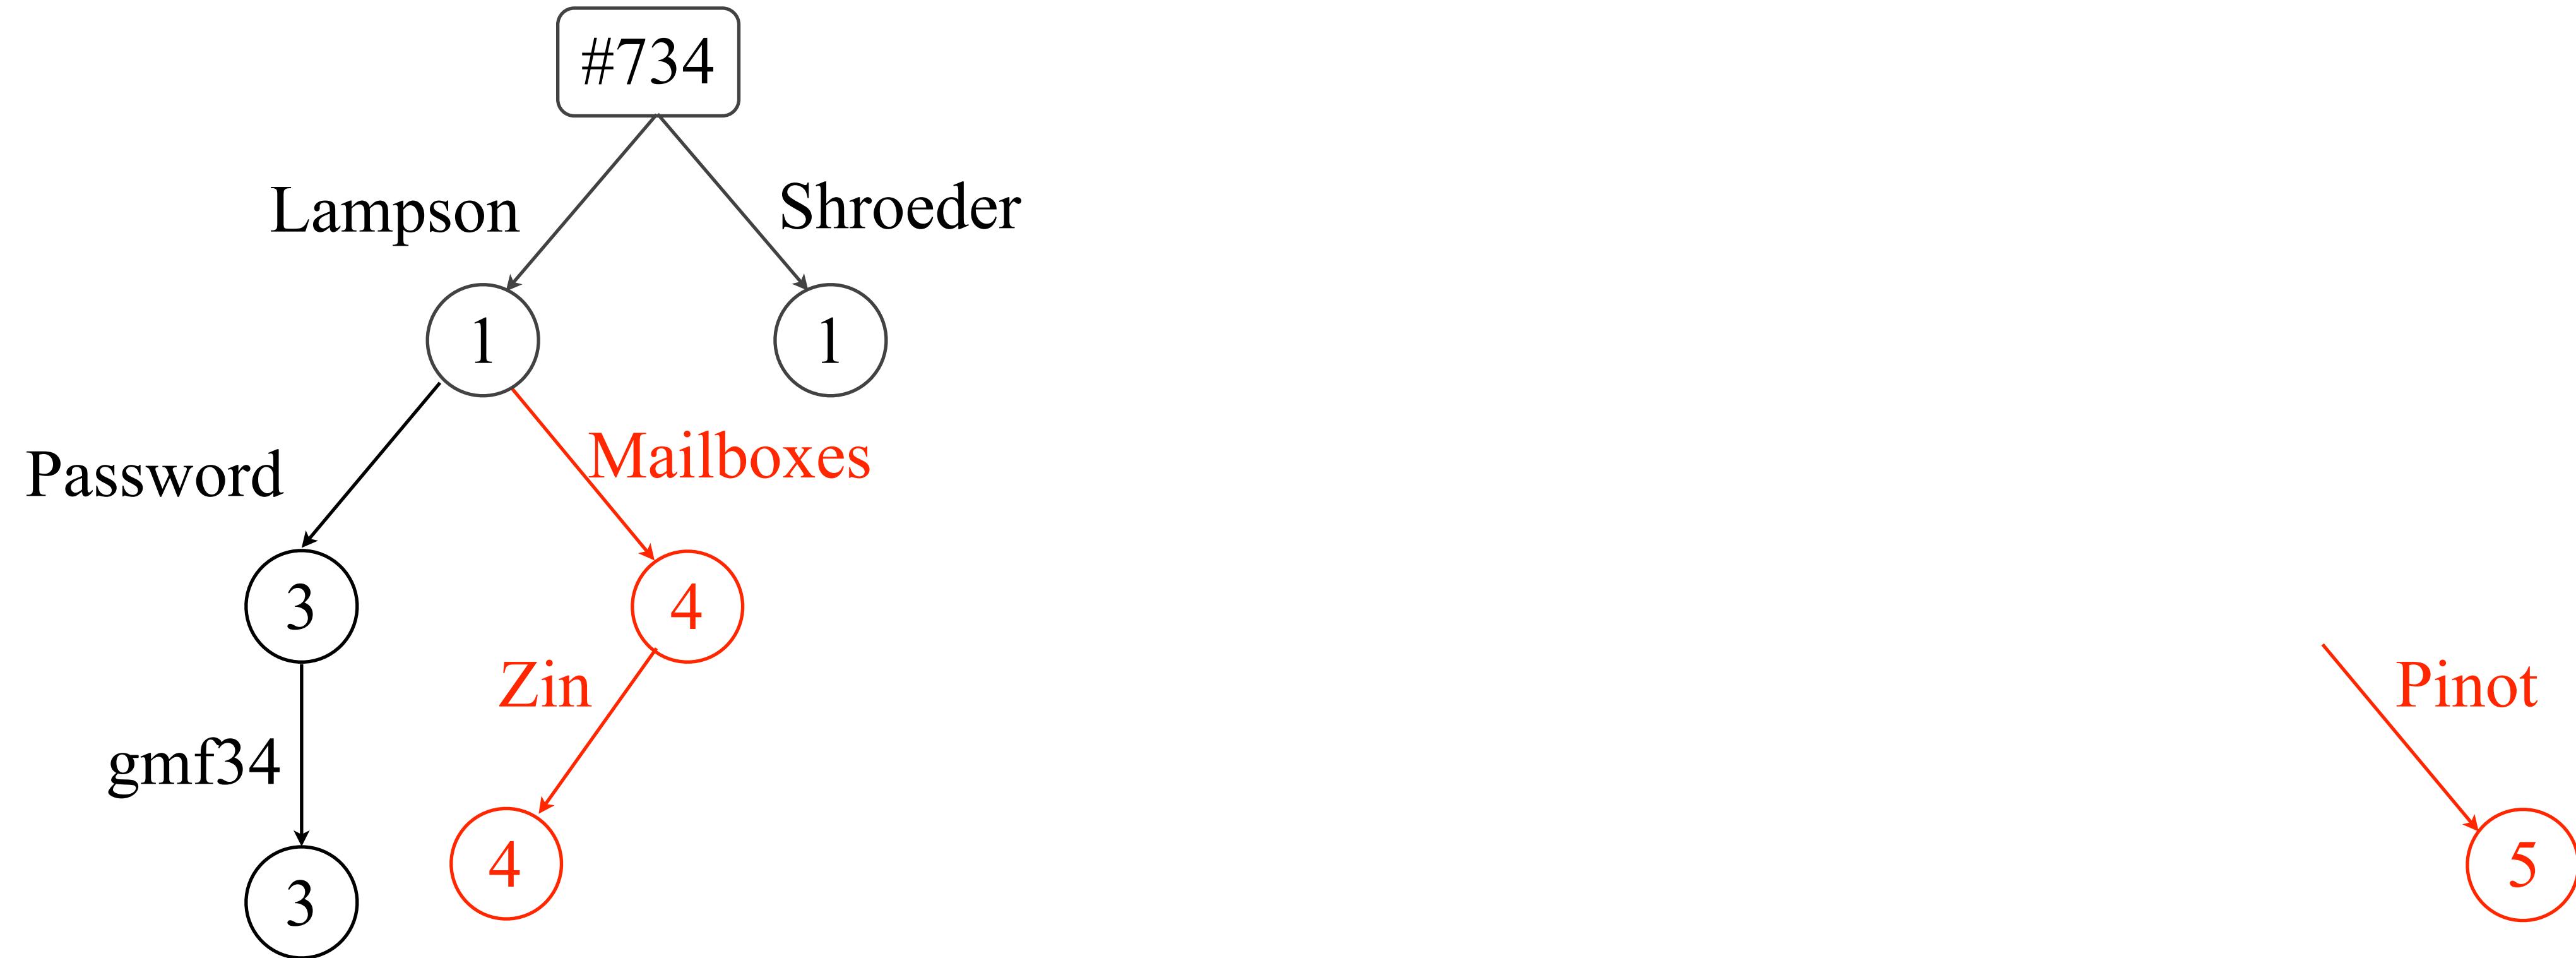

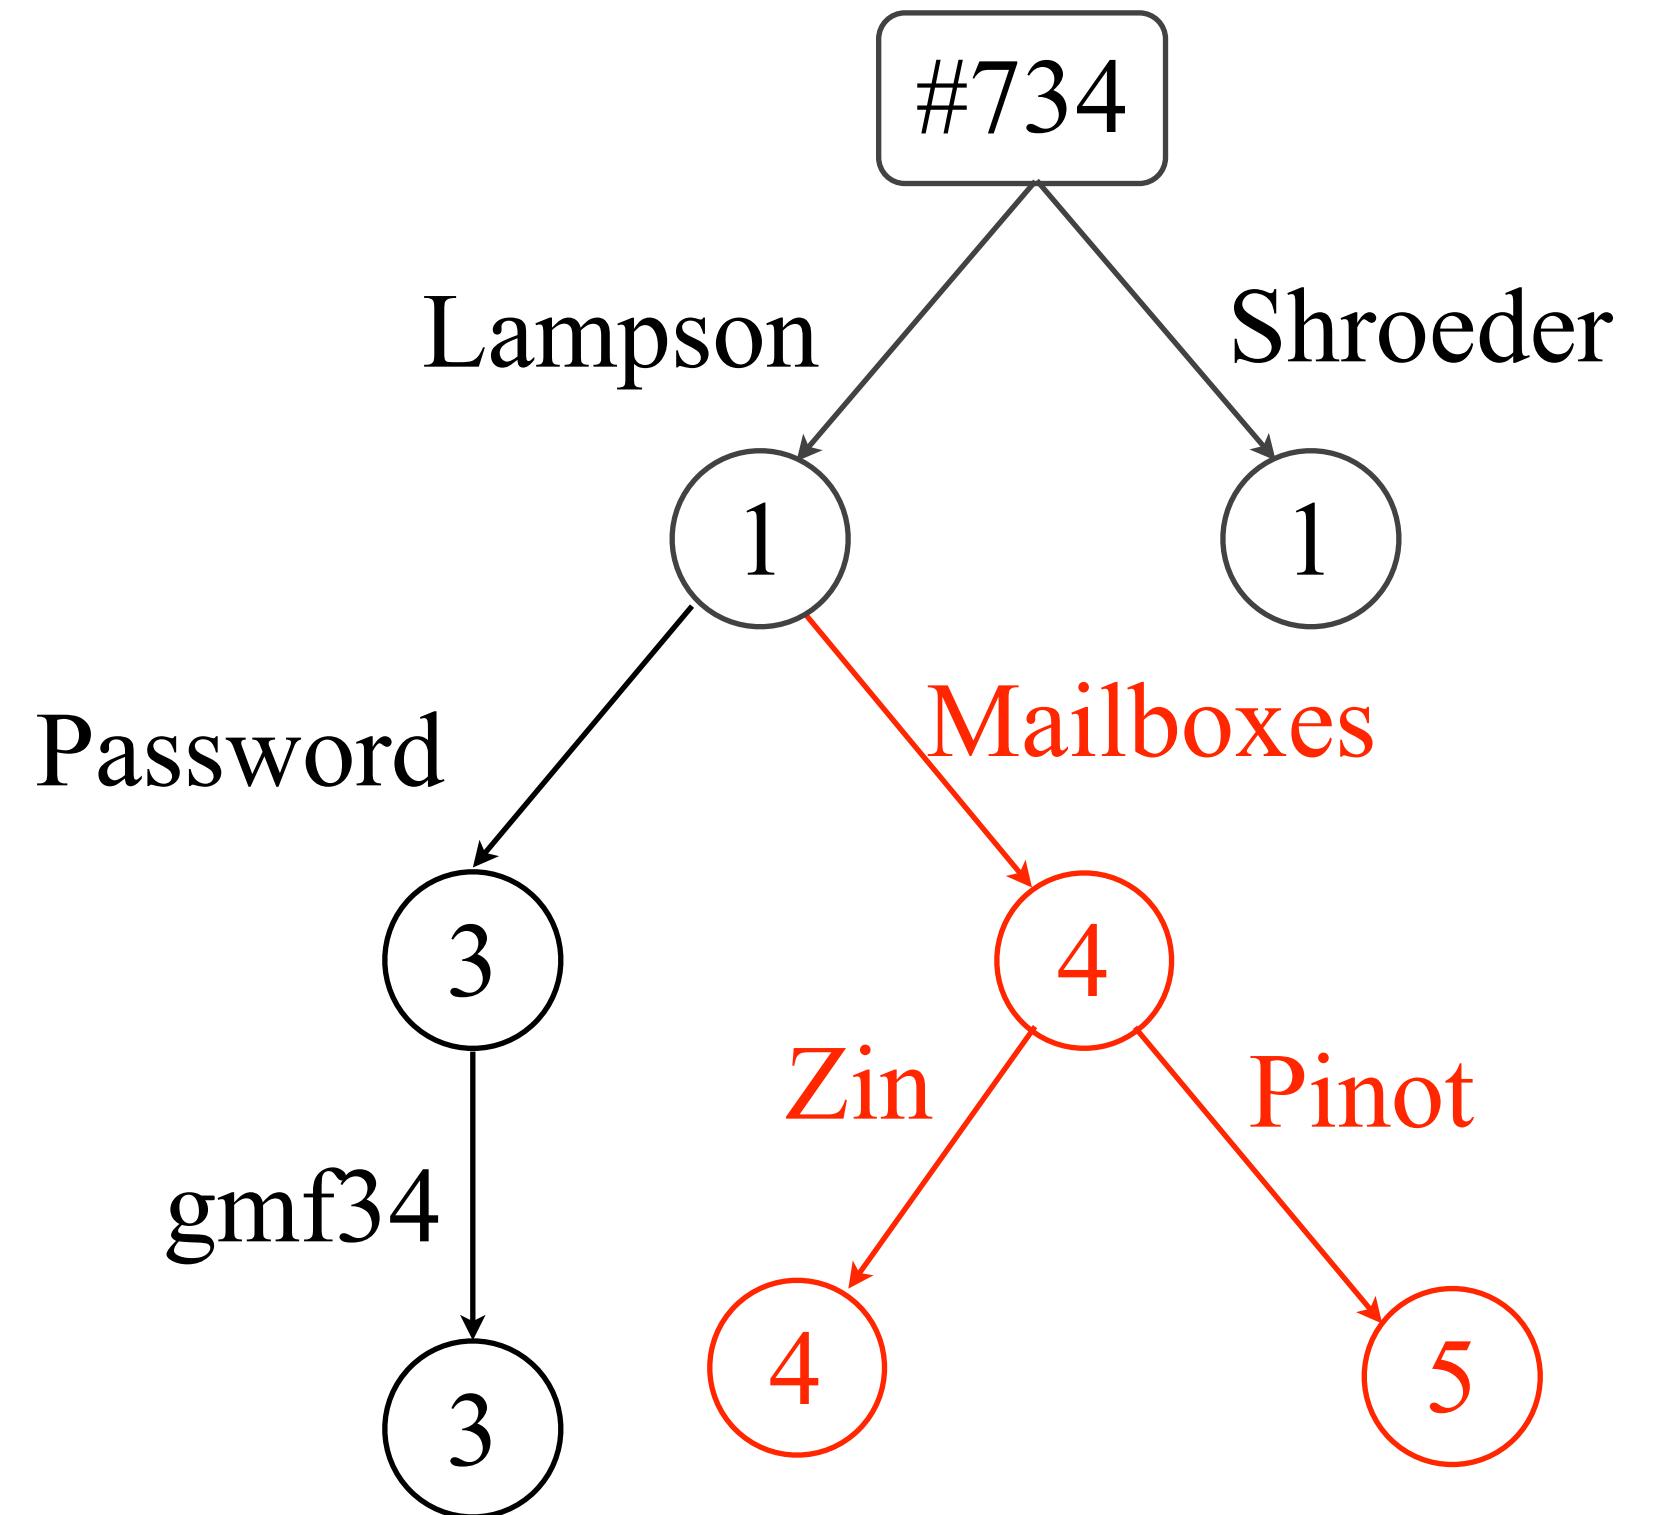

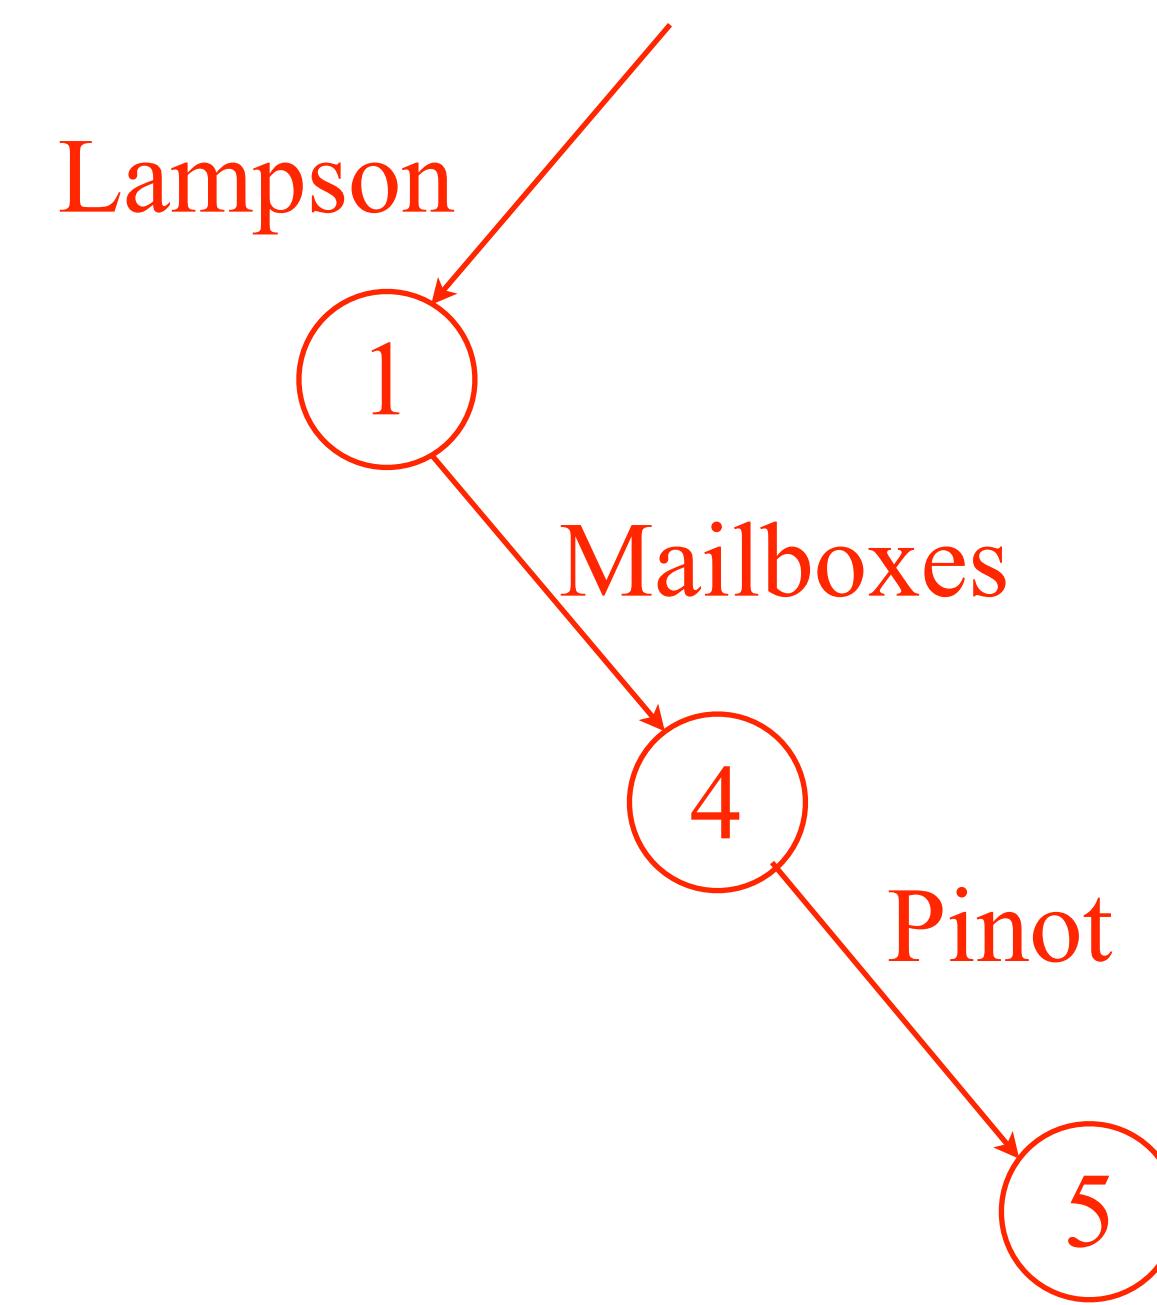

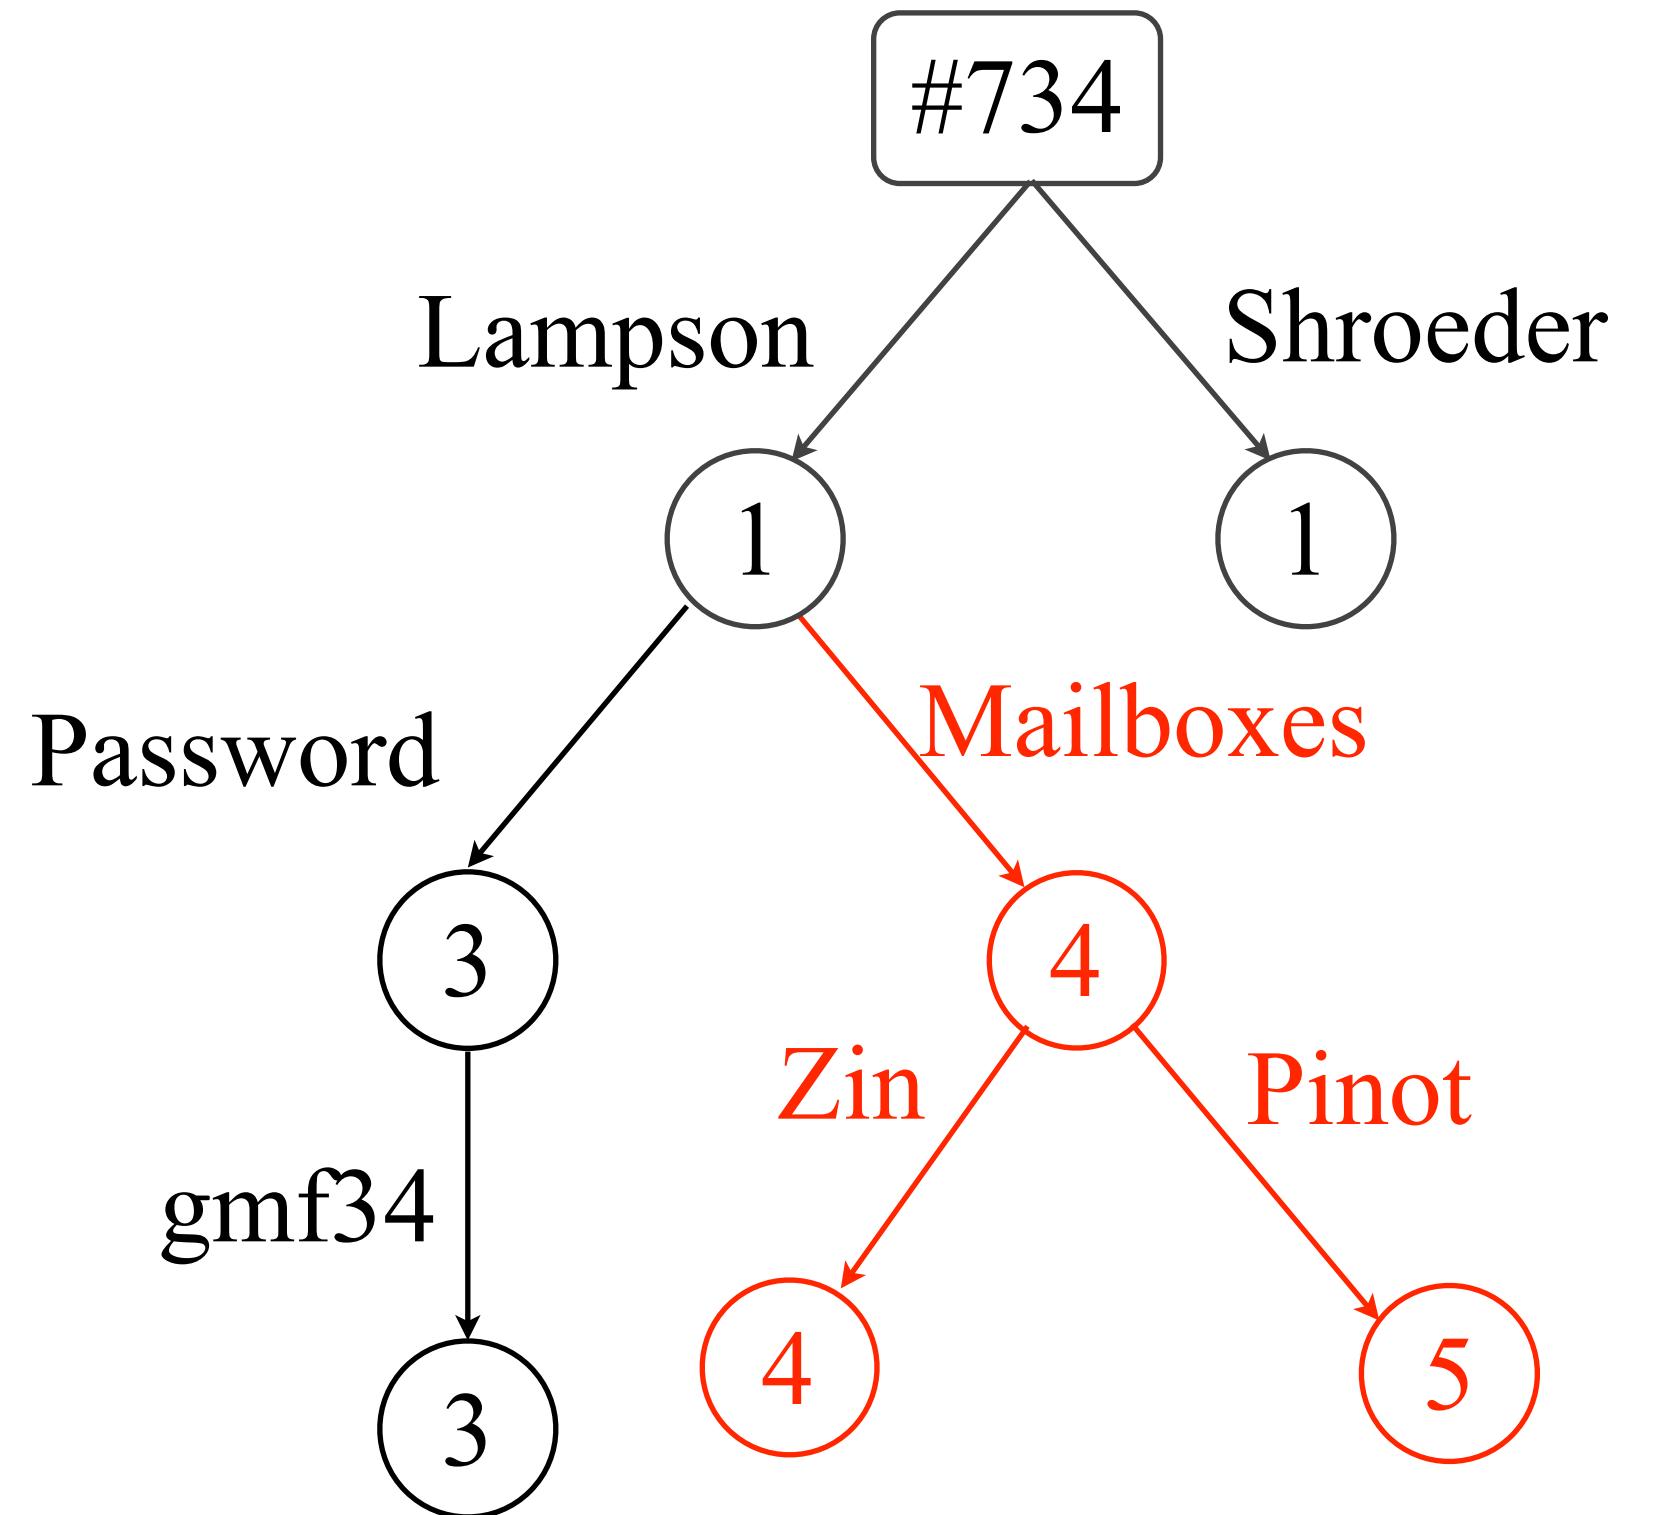

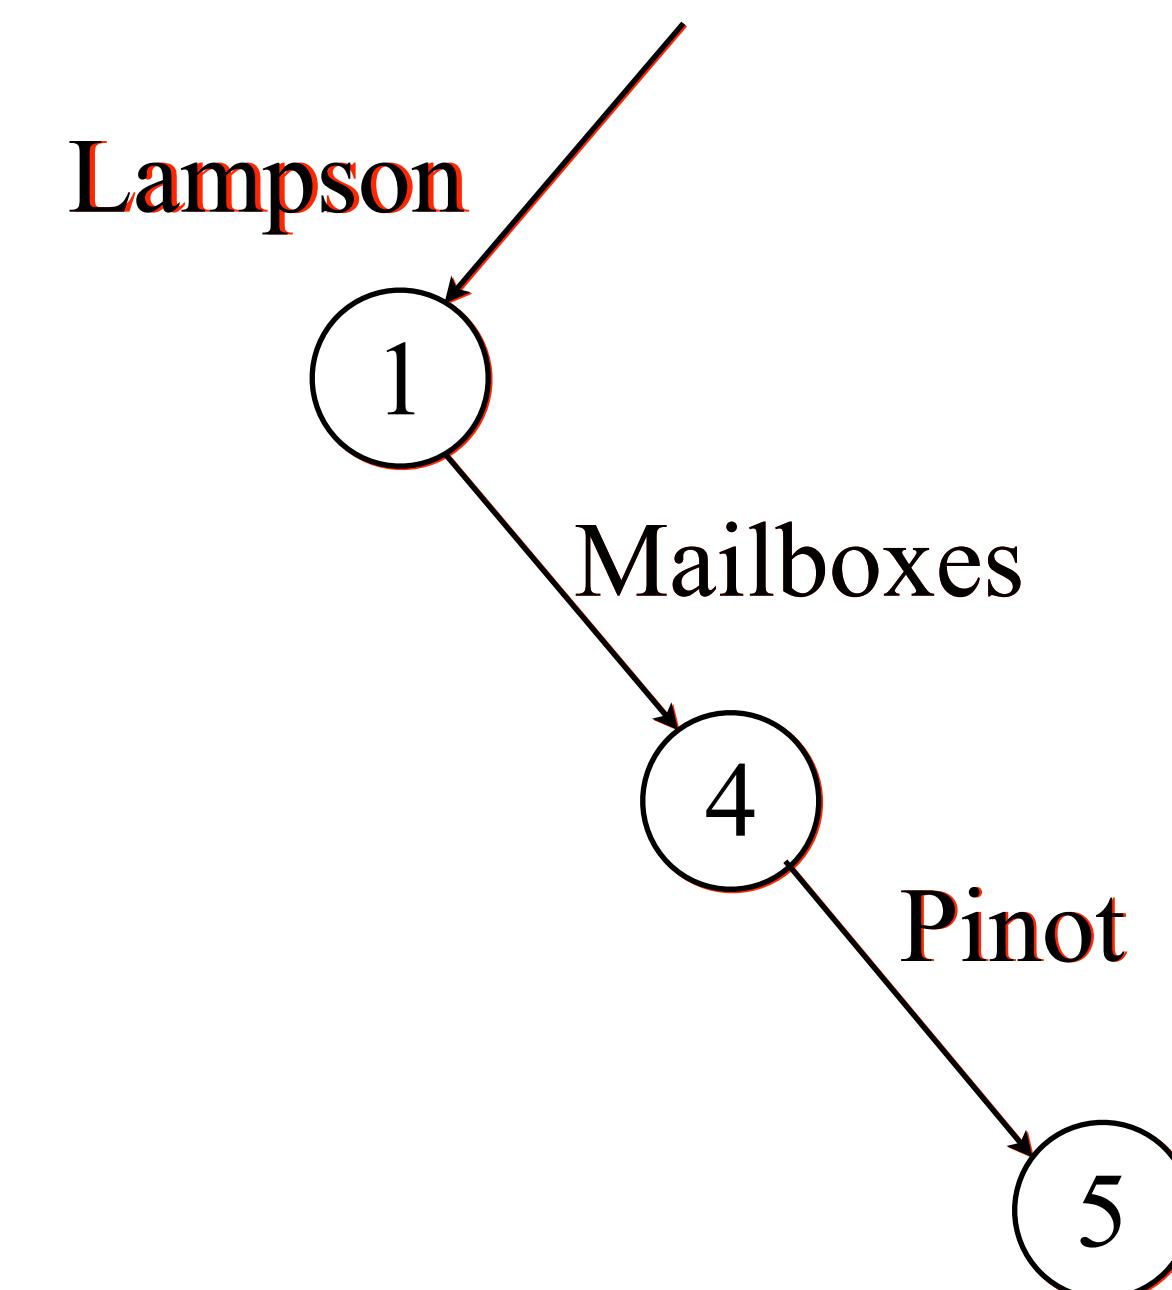

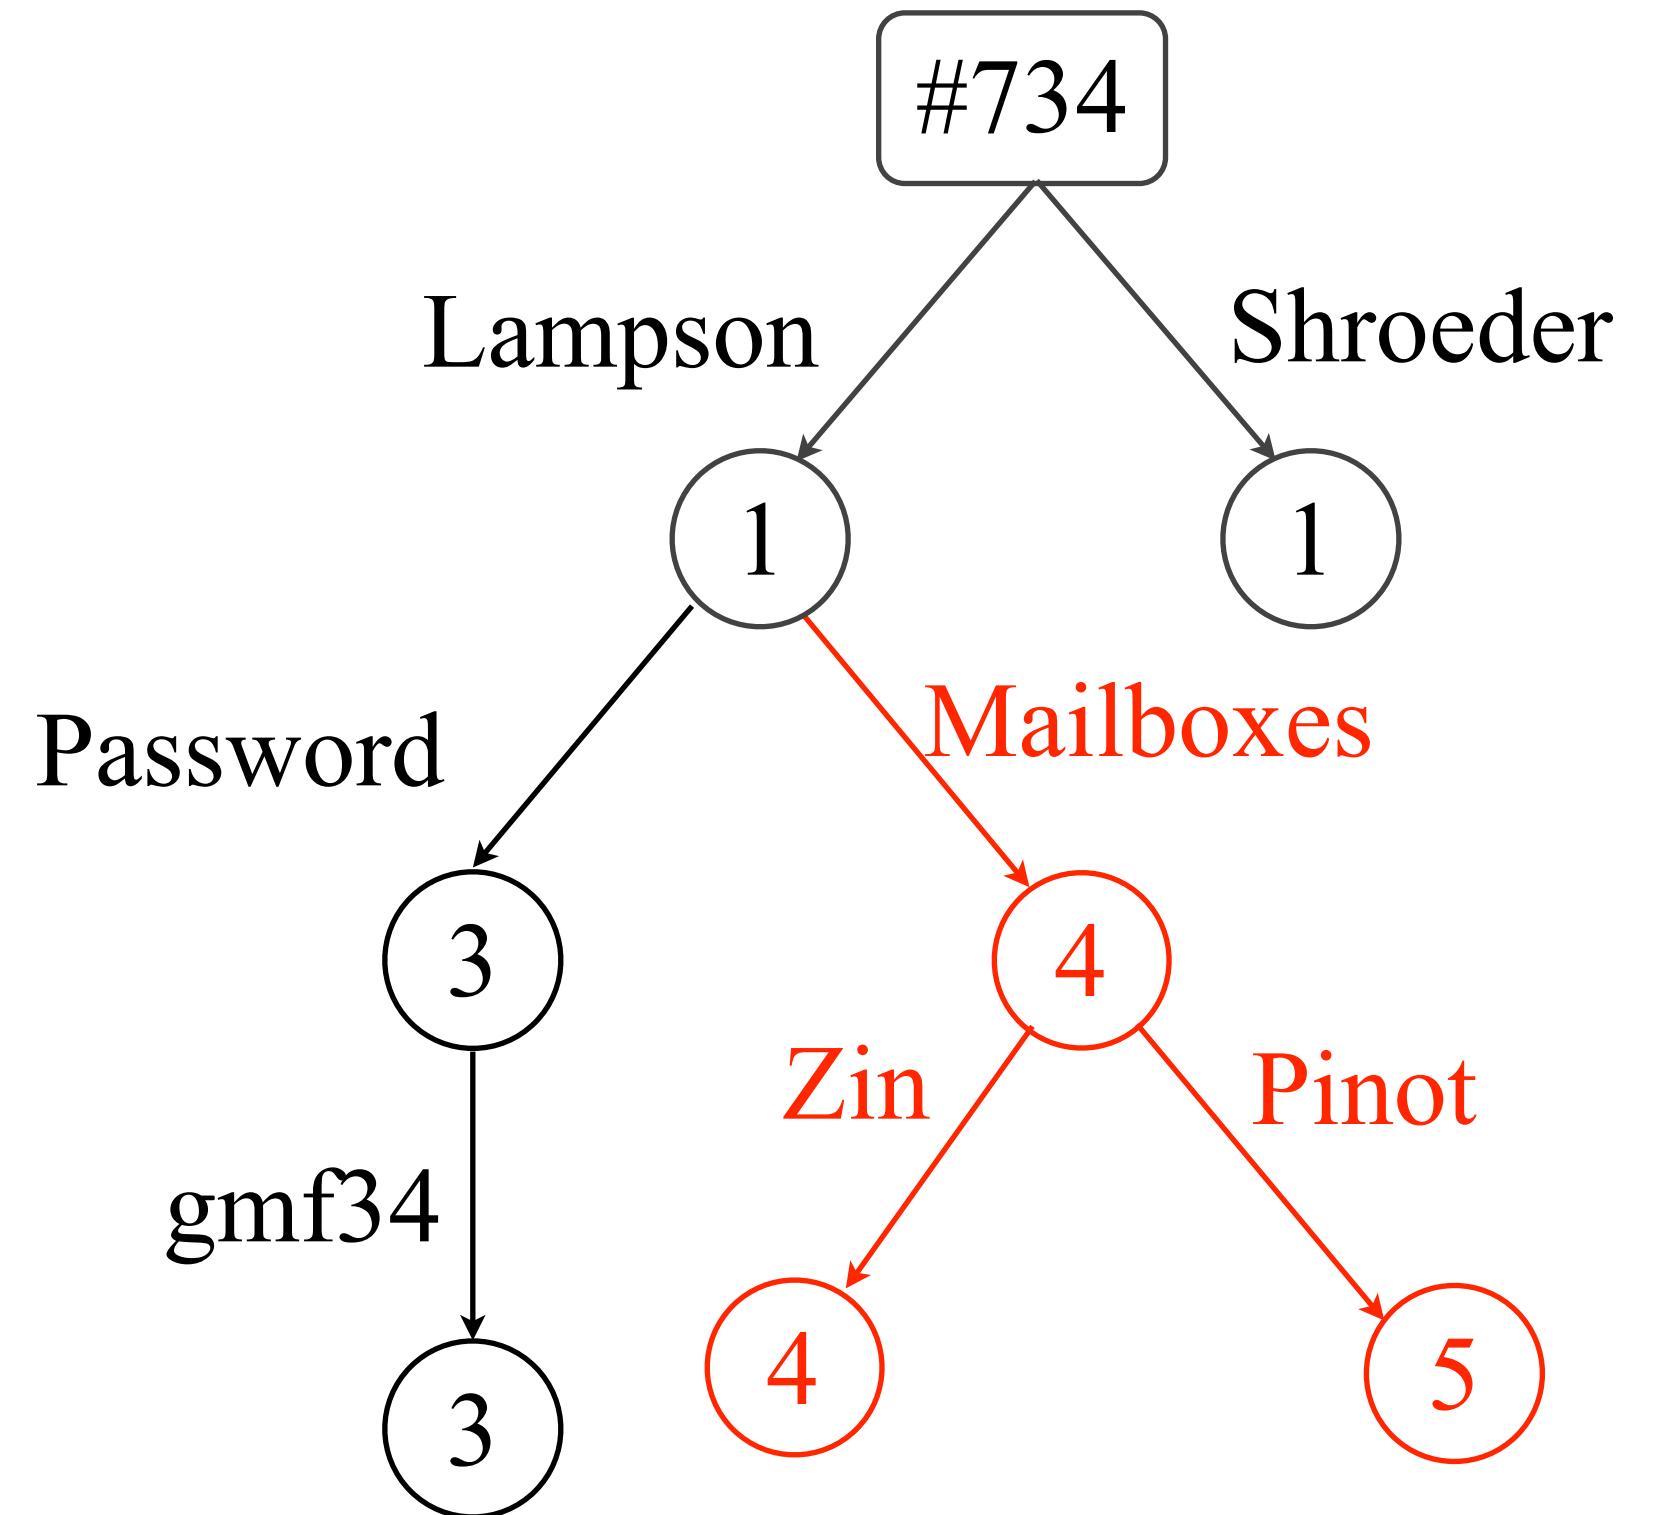

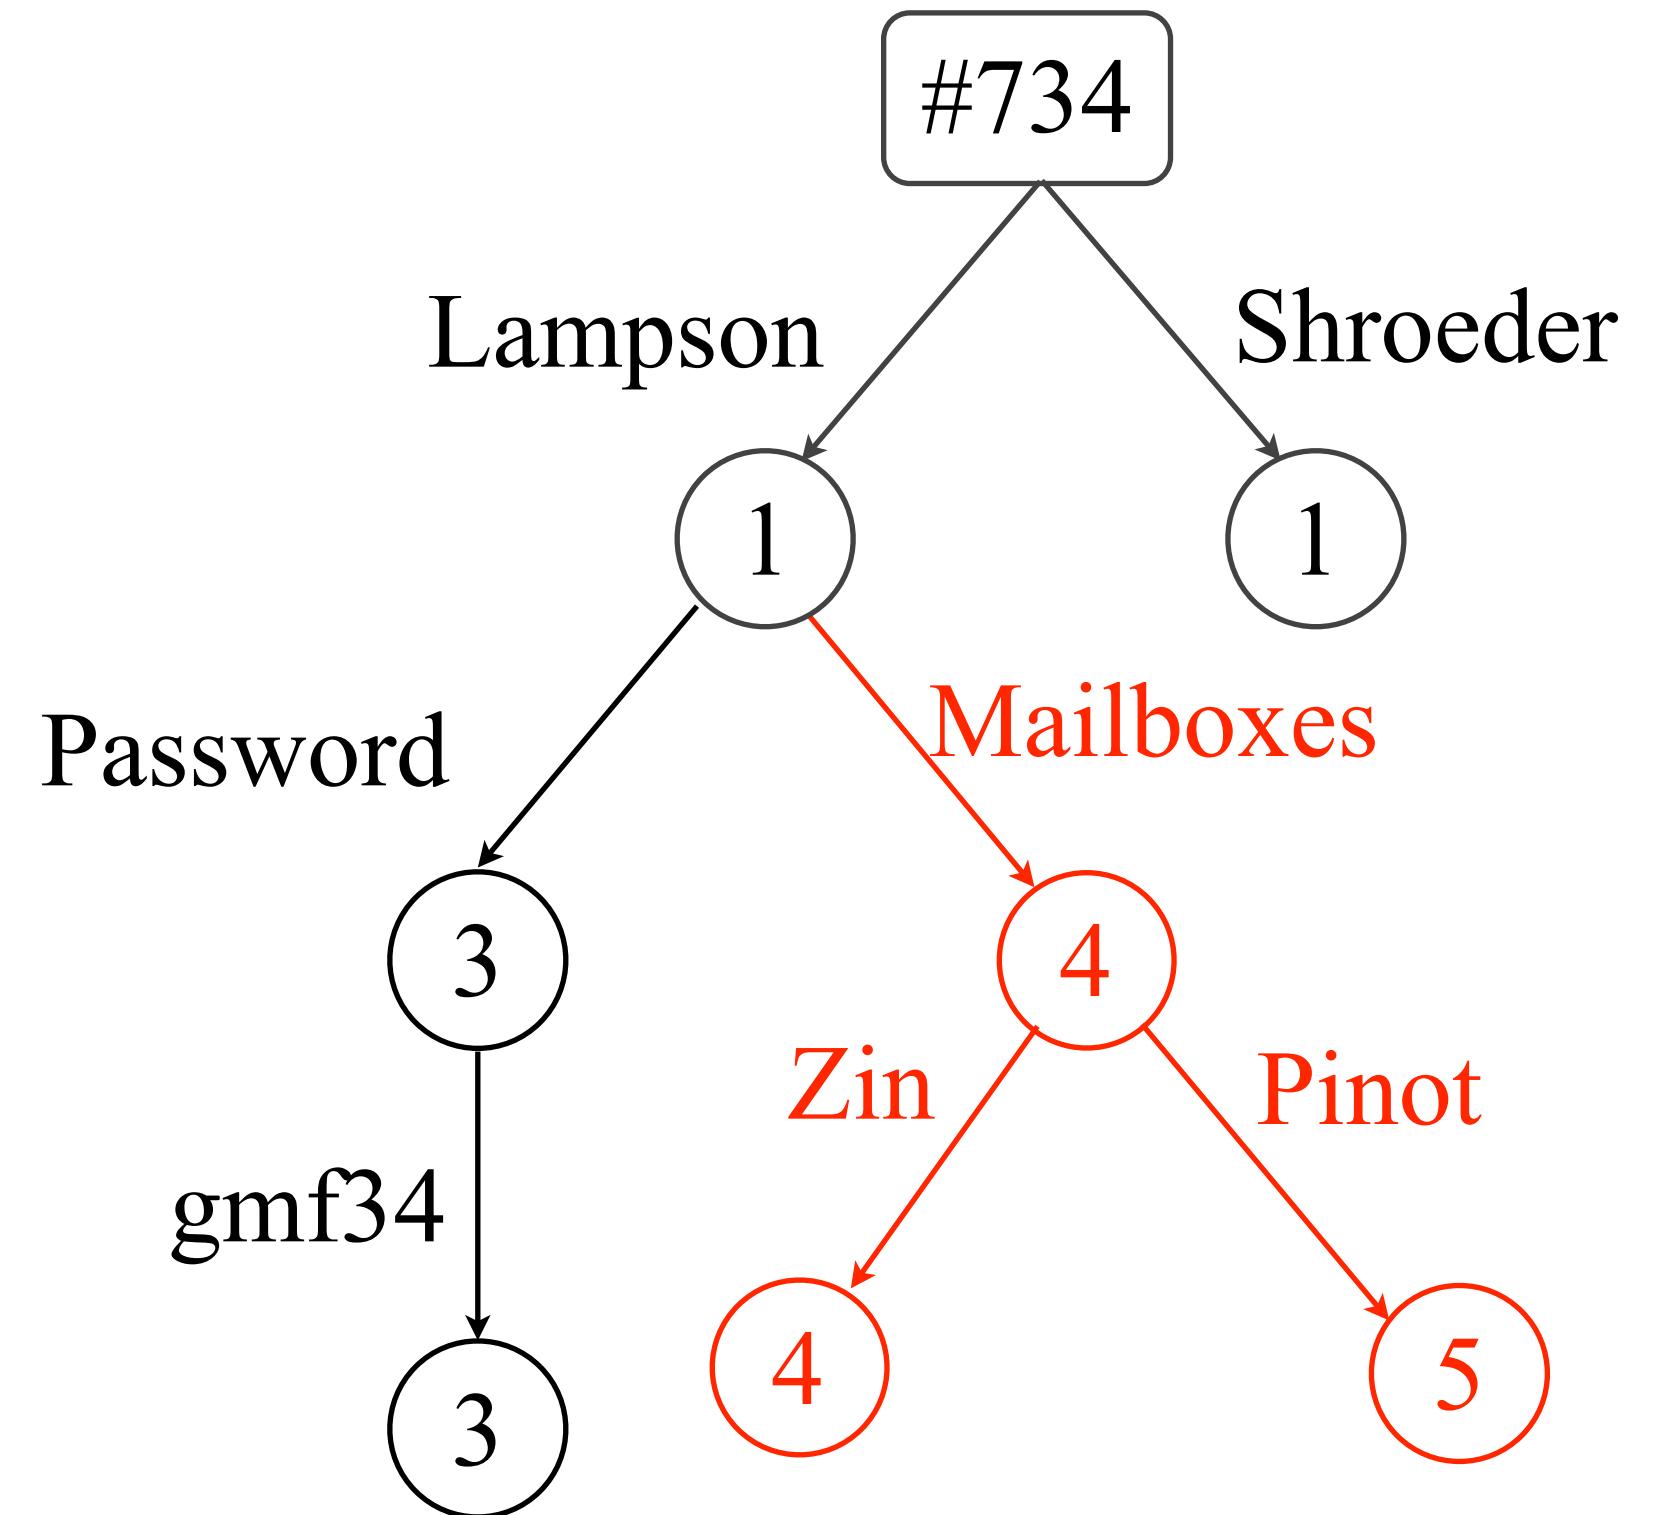

Updates

- **Commutative**: reordering updates does not affect the outcome
- **Idempotent**: reapplying updates does not affect the outcome
- Both achieved through timestamp ordering

Designing a Global Name Service

- Scalability: supports an arbitrary number of names and organizations
 - *achieved through hierarchy*
- Fault-tolerance: keeps functionality even when N servers fail
 - *achieved through redundancy + eventual consistency*
- Clients cache mappings
- Stale mappings avoided through expiration dates
- Updates are commutative and idempotent
